Country Overview

Country Overview

MAURITIUS

Mauritius is an island nation in the Indian Ocean, located to the east of the African continent and to the west of the Indian sub-continent. Although visited by Arab, Malay, and Portuguese sailors between the 10th and 16th centuries, Mauritius was uninhabited until the Dutch took possession in 1598. Abandoned by the Dutch in 1710, it was taken over by the French in 1715 and seized by the British in 1810. It gained independence in 1968. Mauritius has a reputation for stability and racial harmony among its mixed population of Asians, Europeans and Africans, and the country has maintained one of the developing world's most successful democracies. Before, and for several years after, independence in 1968, Mauritius was principally a sugar-based economy. Since independence, the country has developed from a low-income, agriculturally based economy to a middle-income, diversified economy with growing manufacturing, financial, and tourist sectors. Political stability and efforts to diversify have helped Mauritius become one of the region's most prosperous economies.

Chapter 2

Political Overview

History

Although Arab and Malay sailors knew of Mauritius as early as the 10th century in the common era, or C.E., and Portuguese sailors first visited it in the 16th century, Mauritius was uninhabited until 1598 when the Dutch claimed it. Over the next few centuries, Mauritius was increasingly populated by waves of traders, planters and their slaves, indentured laborers, merchants and artisans from various parts of the globe.

Under the control of the crown of the Netherlands, Mauritius was named in honor of the Dutch Prince Maurice of Nassau. The Dutch, however, did not officially colonize the island until 1638. Mauritius remained a crown colony of the Netherlands for less than a century, until 1710, when the Dutch abandoned it. Despite a brief and otherwise un-noteworthy tenure, the Dutch left behind one important legacy that would shape the island's future -- sugar cane.

Five years later, in 1715, the French claimed Mauritius and renamed it Ile de France. During the 1700s, the French established plantations on the island and used imported African slaves to work on them. With this economic system, Mauritius became a prosperous colony under the French East India Company. The French government took direct control of Mauritius (Ile de France) in 1767, and the island served as a naval and privateer base during the Napoleonic Wars.

In 1810, the British ousted the French authorities and confirmed possession of the island. The British took official control under the 1814 Treaty of Paris, and the island regained the name Mauritius. Despite its jurisdiction as a territory of the British crown, French institutions, including the Napoleonic code of law, were maintained. The British also agreed to respect the customs, traditions and languages of the people living there.

Slavery was abolished in 1835, and, as in many of their colonies worldwide, the British introduced indentured workers to replace African slave labor. From the early to mid-19th century, immigrants were brought from the Indian subcontinent in Mauritius to work as indentured laborers. Smaller numbers of settlers also arrived from East Africa and China.

By the 20th century, Mauritius' political status shifted from a British colony to an independent nation. Elections in 1947 for the newly created Legislative Assembly marked Mauritius' first steps

toward self-rule. In 1948 the franchise was granted to all adults who passed a basic literacy test. In 1957, a ministerial form of government was introduced. The first elections with universal adult suffrage were held in 1959. These were won by the Mauritius Labor Party (MLP), whose leader, Dr. (later Sir) Seewoosagur Ramgoolam, became the chief minister in 1961. An independence campaign gained momentum after 1961, when the British agreed to permit additional self-government and eventual independence.

A coalition composed of the MLP, the Muslim Committee of Action, and a traditionalist Hindu party, won a majority in the 1967 Legislative Assembly election, despite opposition from Franco-Mauritian and Creole supporters of the Mauritian Social Democratic Party (PMSD), led by Gaetan Duval. The contest was interpreted locally as a referendum on independence. The achievement of Mauritian independence was preceded by a period of communal strife, largely stimulated by factional interests. The dissent was brought under control with assistance from British troops.

Mauritius began its history as an independent state in 1968. The Mauritius Independence Order established it as a self-governing state with a system of parliamentary democracy. Sir Seewoosagur Ramgoolam, MLP leader and chief minister in the colonial government, became the first prime minister on March 12, 1968. In 1992, Mauritius became a republic within the Commonwealth of Nations.

Political Conditions

Political Chronology

Post-independence politics in Mauritius were turbulent and characterized by coalition and alliance building. Alone or in coalitions, the Mauritius Labour Party (MLP), led by Sir Seewoosagur Ramgoolam, ruled from 1968 until June 1982. The primary opposition force, a left wing

organization called the Mauritian Militant Movement (MMM) was founded by Paul Berenger.

Despite a period of labor unrest that was instigated by the MMM in the 1970s that eventually led to its "unofficial" dissolution, the MMM became the single largest party in the Legislative Assembly. Ramgoolam's MLP coalition remained in power until another bout of industrial unrest led to an electoral upset with an alliance between the Mauritian Militant Movement and the Mauritian Socialist Party (MMM/PSM) winning the 1982 election. Sir Anerood Jugnauth became the new prime minister.

A conflict within the coalition over economic policy and the status of the Creole language led to a collapse of the alliance in 1983. Jugnauth appointed a new government and formed a new party, the Militant Socialist Movement. This new party merged with the PSM defectors to form the Mauritian Socialist Movement (MSM). Because Jugnauth's newly appointed government was unable to command a majority in the Legislative Assembly, however, a general election was called for late 1983.

The new MSM party aligned itself with the MLP, now led by Sir Satcam Boolel, as well as the Mauritian Social Democratic Party (PMSD) and won a majority of seats. Following the election, Jugnauth remained as Prime Minister and appointed a new government. Relations between the MSM and the MLP deteriorated soon thereafter and the MLP withdrew from the alliance.

Following a scandal in 1985 where Jugnauth refused to publicly name his cabinet ministers who were arrested in the Netherlands for drug smuggling, another extensive cabinet shuffle ensued. This modification led to the reintegration of the MLP into the government in 1986. Meanwhile, a host of government personnel were implicated in the drug smuggling affair.

In 1987, Jugnauth dissolved the Legislative Assembly and a general election was held. The MSM again formed an alliance with the MLP and the PMSD and won a majority of seats, although only 49.8 percent of the popular vote. Another government was formed, but a year later, in 1988, the ruling coalition was weakened when the PMSD withdrew.

In July 1990, however, the MSM realigned with the MMM. The two parties mutually agreed upon a mandate to promote constitutional measures that would allow Mauritius to become a republic. A year later, in the 1991 national elections, the MSM/MMM alliance won 59 of the 62 directly elected seats.

As promised in its electoral program, the MSM/MMM alliance amended the 1968 constitution, making Mauritius a republic within the Commonwealth. It was proposed that Jugnauth would remain as prime minister and head of government. As well, Berenger, leader of the MMM, would become the newly established president. In the legislature, however, the MLP and the PMSD jointly opposed the draft amendments.

Later in 1991, Jugnauth dissolved the legislature and another election was held. This time, the MSM/MMM coalition won a definitive majority and Jugnauth announced that subject to legislative approval, Mauritius would become a republic within the Commonwealth on March 12, 1992. With the new majority in the Legislative Assembly, the requisite three-quarters approval was achieved, and the constitutional changes were approved on Dec. 10, 1991.

On March 12, 1992, the Legislative Assembly was re-designated as a National Assembly and Sir Veerrasamy Ringadoo was named interim president. Upon legislative approval in June 1992, Catoom Uteem of the MMM became the first president. Although Berenger had not become president as the original MSM/MMM agreement stipulated, Jugnauth included him within the cabinet.

Meanwhile, Jugnauth had his wife's depiction emblazoned on a newly issued bank note. He also threatened Harish Boodhoo, opposition leader of the PSM, for planning a demonstration. In addition, he utilized a series of maneuvers to prevent Dr. Navinchandra Ramgoolam, the son of Sir Seewoosagur Ramgoolam and the leader of the MLP, from attending National Assembly sessions. Finally, he dismissed Paul Berenger from his cabinet for criticizing government policy.

In October 1992, as a consequence of these authoritarian measures, various political forces began to call for the resignation of Jugnauth. He remained in office, however, although his government coalition came under increasing pressure during 1993. This was partly due to disputes within the MMM, but also in addition to severe conflicts between the MSM and the MMM. By 1994, the MMM agreed to the terms of an alliance with the MLP, in order to contest the next election. As a countermove, however, Jugnauth announced that that the government would remain in office until the conclusion of its mandate in 1996.

In November 1995, however, the government was defeated in a parliamentary vote on a constitutional issue regarding language instruction. This led to the dissolution of the National Assembly and a subsequent election in December, despite Jugnauth's earlier assertion that the government would finish its mandate.

In the 1995 election, the MLP/MMM alliance won a decisive victory capturing 60 seats in the legislature and 65.2 percent of the popular vote. The MSM acquired only 19.7 percent of the vote but no actual seats. Various opposition parties, as well as the fundamentalist Islamic organization, Hezbollah, secured the remaining six seats allocated under the "best loser" system. Analysts attributed these victories to the public's discontent over the scandals that plagued Jugnauth's government.

Dr. Navinchandra Ramgoolam, the head of the MLP whom Jugnauth had tried to prevent from attending National Assembly sessions, became the new prime minister. Paul Berenger, the head of

the MMM and the person who was earlier dismissed from Jugnauth's cabinet, became the deputy prime minister. Uteem remained as the president.

In late 1996, serious divisions began to emerge within the coalition, especially between Ramgoolam and Berenger over the allocation of ministerial duties. By early 1997, rumors began to circulate about a possible alliance between the MMM and the MSM. In response, Ramgoolam supposedly solicited support from the PMSD, in case the MMM decided to withdraw from the government. By early 1998, Rajkeshwur Kailash Purryag replaced Berenger as deputy prime minister.

In February 1999, the capital of Mauritius erupted in violence. The catalyst was the death of a popular reggae singer, Kaya, while in the hands of police custody. Police had been upset by calls from Kaya, among other civic notables, for the legalization of marijuana. Kaya had been arrested with several youths for smoking marijuana in public, but while the others were quickly released, Kaya was held, dying shortly thereafter after what is presumed to be police beatings.

The violence that followed the news of his death reflected a greater ethnic divide, however. Creole families have often expressed the view that the "Mauritian miracle" of political and economic ascendancy has passed them by. (See special section below for more details about the "Mauritian miracle".) The death of Kaya ignited the already smoldering feelings of disdain. Within three days 34 bank counters were damaged, shops were looted, service stations were attacked, textile plants were set on fire, and 11 people died. Police were ill-prepared for such a demonstration and were largely ineffective at bringing it under control.

Yet, nearly as fast as the riots broke out, they abated. Leaders from the MMM and the MSM joined with Ramgoolam in calling for calm. While the violence did temporarily damage the tourist trade, the rapidity of the resolve avoided any catastrophic loss of foreign business in Port Louis. By December 1999, political risk companies, such as Control Risks Group, were once again evaluating Mauritius as "low risk."

In September 1999, the MLP, led by Prime Minister Navinchandra Ramgoolam, in alliance with the PMSD, won a by-election in the constituency of Beau-Bassin/Petite Riviere. Its candidate, Xavier-Luc Duval, son of late deputy prime minister, Sir Gatan Duval, was proclaimed elected with at least a thousand votes ahead of his principal challenger, Francoise Labelle, the candidate of the opposition. The by-election was held to fill the vacancy created on March 5, 1999 by the resignation of a member of the opposition party, the MMM. The parties in power now hold 37 seats in the National Assembly, with 23 seats in opposition hands. As a result of the by-election, the prime minister announced the 25-member cabinet. The newly elected member of parliament Xavier-Luc Duval, was appointed to the new cabinet.

In what seemed like a move towards dynasticism, in October 1999 Pravind Jugnauth, son of Anerood Jugnauth, was nominated as deputy leader of the MSM. This made him an heir apparent

to his father's political legacy.

Despite the positioning of Pravind Jugnauth, entering into 2000 Anerood Jugnauth appeared unready to step down from his MSM roost. Thus when Prime Minister Ramgoolam dissolved parliament in favor of new election on Aug. 11, Anerood Jugnauth was well-placed to pursue a return to power. Following the successful pattern of 1982 and 1991, Jugnauth joined in a coalition with Paul Berenger and the MMM. Under the coalition agreement, Jugnauth would be prime minister and Berenger deputy prime minister. After three years the constitutional shift to a quasi-presidential system would take effect, Jugnauth would become president and Berenger prime minister.

The elections, held Sept. 11, 2000, went off remarkably smoothly. There was no violence, and there were no allegations of fraud. Voter turnout was impressively high at 81 percent of the 800,000 registered voters. There were 43 political parties vying for power, but as expected it came down to a contest between the incumbent MLP and the MSM-MMM coalition. The MSM-MMM won 51.7 percent to the MLP's 36.6 percent. The MSM-MMM coalition took a total of 54 seats, the MLP took six seats, and the Rodrigues People's Organization, predominantly supported by Creoles, was awarded two seats despite a virtual non-showing at the polls owing to the law of proportional representation.

Prime Minister Ramgoolam conceded defeat and stepped aside almost immediately; all other parties accepted the results within three days, and Jugnauth was sworn in as prime minister once again within the week.

While the elections were without problems, it was unclear whether or not Jugnauth and Berenger could successfully co-rule. Discord started growing between the two by the end of 2000. Part of the discord was attributable to the Hindu divide. Berenger made overtures to the Hindi leader of the Socialist Party, Harish Boodhoo. For his part, Boodhoo was director of the Sunday Vani weekly and a significant challenger to Jugnauth's authority within the Hindi community. Berenger saw an accord with Boodhoo as an opportunity to gain favor within the Hindi community.

Adding to this discord was the assassination of Vanessa Lagesse in March 2001. Her father-in-law, Maurice Tostee, was indicted, causing a stir in the Franco-Mauritian community. The Lagesse family was known as one of the wealthiest and most powerful in Mauritius. Complicating matters was the fact of Berenger's family ties to the Lagesse family. Berenger believed that Jugnauth had been trying to use Vanessa Lagesse's death to his political advantage while smearing a powerful French family. Yet despite the discord between Jugnauth and Berenger, they seemed to be able to continue to work together nonetheless, limiting the fighting to a personal affair and protecting the institutions they serve.

In 2002, the President of Mauritius, Cassam Uteem, resigned in protest of a controversial anti-

terrorism bill. Uteem had been ensconced in a battle with the parliament over the law, which includes a provision that would allow police to hold suspects for longer periods without charging them; the law would also deny suspects the right to legal representation. The Mauritian opposition argued that the law deteriorates the rights of suspects and for his part, Uteem refused to sign the bill, thus forcing parliament into a special session. He later resigned from office. His successor, Angidi Chettiar, also refused to sign the bill and promptly resigned as well. The third president in five days, Arianga Pillay, signed the bill, making it law. Pillay was functioning as "acting president" and was actually the Supreme Court Justice.

Although Prime Minister Jugnauth is the head of government, the constitution of Mauritius requires the head of state -- the president -- to actually sign laws into existence. If a president does not sign laws proposed and passed by parliament, he/she must resign from office, as was the case in these circumstances. Meanwhile, Prime Minister Jugnauth attempted to assuage the doubts of critics noting that the law would only be applied to "real terrorists." Following the fracas involving the terrorism bill, Carl Auguste Offman was later formalized as the official president and new head of state.

In 2003, as had been previously determined, Paul Berenger was sworn into office as Mauritius' new prime minister. As a Mauritian of French descent, he is the first person of minority ancestry to hold the post as head of government. Likewise, former Prime Minister Anerood Jugnauth stepped down from office. Jugnauth was inaugurated as president in October and will hold that post until the next general elections in 2005. As noted above, Berenger and Jugnauth signed an electoral agreement in 2000 linking their two parties and providing for this transition of power.

It appears likely that the fate of the two leaders are tied together. For his part, it is unlikely that Berenger can succeed as prime minister without the support of Jugnauth. There has never been a non-Hindi in the role of prime minister in Mauritius. Meanwhile, the eventual success of Pravind Jugnauth -- the son and heir apparent to Anerood Jugnauth's political legacy -- will depend on Berenger's strides in the next few years. Indeed, the intended institutional shift giving more power to the president is a risky exercise. Both men appear to genuinely want peace and prosperity, and if they are going to maintain this trend in the face of constitutional change, then, they will have to work together.

A by-election was held in December 2003 to fill the seat left vacant by Anerood Jugnauth. In a poll with 37 candidates, Rajeesh Jeetah of the Mauritian Labour Party won. Bolstered by the victory, the Labour party called for early parliamentary elections.

Over the course of 2004, the Mauritian government faced growing discontent from the populace over the flagging economy. Unemployment rose to 10.2 percent and the textile and sugar industries continued to cut jobs. The tourism industry showed signs of stagnation. In addition, in 2004, the trade deficit rose to nearly \$450 million. Youth groups and civil servants took to the

streets to protest the lack of jobs and unemployment benefits.

The government was making efforts to fight corruption in Mauritius. The Independent Anti-Corruption Commission arrested former treasury secretary Dev Manraj in connection with the pilfering of a pension fund. Manraj was charged with the misappropriation of \$30 million in January 2004. Nine people were arrested in connection with the investigation since January 2003. In June 2004, the Southern African Development Community held a meeting in Mauritius to discuss corruption. Later that month Mauritius became the third country to ratify the United Nation's Convention against Corruption.

A year later in July 2005, the Electoral Commission of Mauritius declared that the opposition Social Alliance, led by Navin Ramgoolam, defeated the ruling party in the country's parliamentary elections held on July 3, 2005. Ramgoolam will again assume the office of the prime minister; he had served as the country's head of government in 2000. The opposition acquired 38 seats in the national assembly, while the ruling coalition of the Mauritian Militant Movement and the Militant Socialist Movement garnered 22 seats. Two other seats went to the Rodrigues People's Organization on the neighboring island of Rodrigues. Eight more parliamentarians were to be nominated by President Anerood Jugnauth to represent ethnic minorities, thus completing Mauritius' 70-member parliament.

Prime Minister Paul Berenger accepted defeat on behalf of the ruling party and resigned just after the final results of the polls were declared. Other losers in the election included Deputy Prime Minister and deputy head of the ruling party, Pravind Jugnauth, son of the Mauritian president. Ten cabinet ministers also lost their seats.

In April 2006, about one hundred former residents of the Chagos Archipelago, which has been claimed by Mauritius as part of its sovereign territory, returned after four decades of living elsewhere. They had been evicted by the United Kingdom because of plans to establish a United States military base on the island of Diego Garcia. Their eviction had sparked a lengthy legal battle over their right to return home. Finally, in May 2007, the Court of Appeal in the United Kingdom ruled that the Chagos Islands exiles had the right of return to their home.

On September 19, 2008, presidential elections were held in Mauritius. The incumbent head of state, Anerood Jugnauth, was re-elected to power by a unanimous vote within the legislative body, called the National Assembly.

On March 31, 2010, Prime Minister Navinchandra Ramgoolam of Mauritius dissolved parliament, effectively paving the way for fresh elections. Indeed, he announced that citizens of Mauritius would go to the polls on May 5, 2010, to vote in snap elections. In a national address broadcast on television and radio, he said: "This afternoon, I have informed the President of the Republic

that I shall dissolve the National Assembly today. I have decided to call the country for the elections on May 5." In keeping with his promise to concentrate on economic policies in 2009 and elections in 2010, Prime Minister Ramgoolam said: "The hour of the democratic rendezvous has arrived. I have arrived at the end of my mandate." Ramgoolam also touted his record of stability and economic stewardship saying, "My government took courageous measures within the last five years and the country was stable." He noted there had been economic growth "even during the economic crisis."

In addition to Ramgoolam's ruling party, the Mauritius Labor Party, the other parties contesting the election were the Militant Socialist Movement or MSM of Pravind Jugnauth, Mauritian Militant Movement or MMM of Paul Berenger, Mouvement Republicain or MR, Rodrigues Movement or MR, and Rodrigues Peoples Organization or OPR. Ahead of elections, the Mauritius Labor Party said it would join with the Militant Socialist Movement to form an alliance called Alliance de L'avenir.

On election day, the alliance led by Prime Minister Navin Ramgoolam won the parliamentary elections. According to the electoral commission of Mauritius, the ruling alliance saw 41 deputies elected to the 60-seat National Assembly. The opposition alliance, led by Paul Berenger, garnered only 18 parliamentary seats. Not only was Prime Minister Ramgoolam's political strength consolidated in parliament, he also gained the distinction of being the first head of government since 1991 to win a second term in office. Ramgoolam campaigned on a platform of ending savings and property taxes, maintaining a free transportation system, and free internet access via laptop computer for all children, with an eye on improved technological prowess among the youth.

On May 11, 2010, Prime Minister Ramgoolam made clear that his election alliance would prevail in the realm of governance. To that end, Pravind Jugnauth, leader of the country's Militant Socialist Movement, was named as the new Vice Prime Minister and Finance Minister.

In late July 2011, six ministers from the Militant Socialist Movement (MSM), which is part of the ruling alliance of Mauritius, resigned from the government. This move came in the aftermath of the arrest of the Minister of Health over alleged corruption. Maya Hanoomanjee, also of the MSM, was accused of abuse of power by the country's Anti-Corruption Commission (ICAC). Note that the resigning ministers were: Deputy Prime Minister and Finance Minister Pravind Jugnauth, Minister of Tourism Nando Bodha, Minister of Industry Showkutally Soodhun, Minister of Social Security Leela Devi-Dookun Luchoomun, Minister of Public Service Ashit Gungah. The resignations followed that of the Minister of Health, Maya Hanoomanjee, from the same MSM, after she was accused of abuse of power by the Anti-Corruption Commission (ICAC). In the first week of August 2011 -- a week after the resignation of six cabinet ministers -- Mauritian Prime Minister Navin Ramgoolam formed a new government that included two members of the MSM.

By September 2011, the political scene in Mauritius remained in a state of chaos in the aftermath of the mass resignations and corruption scandal noted just above. The mass resignations from

members of the MSM, who have been serving in a coalition with Prime Minister Ramgoolam's Labor Party, effectively left the head of government dealing with an internal party revolt. Members of Prime Minister Ramgoolam's Labor Party were apparently upset that he had chosen to include the MSM rather than selecting cabinet members from within the party fold. For his part, the prime minister had gone down that path in order to maintain an operational majority needed to govern the country, but now that majority was being challenged by angry members of his own Labor Party. This state of political turbulence could set the stage for voters in Mauritius to return to the polls again only a year and a half after the previous elections. However, by the end of 2011, no such election had ensued.

In March 2012, President Anerood Jugnauth of Mauritius officially submitted his resignation from office. Jugnauth, who was elected in an internal election by the National Assembly in 2003, said that he was resigning to join the opposition. At issue for the outgoing president was his ongoing feud with Prime Minister Navinchandra Ramgoolam. That row was spurred by the announcement by opposition leader, Paul Berenger of the Mauritius Militant Movement (MMM), that a new opposition alliance would be formed. Jugnauth, as the founder of the Mauritius Socialist Movement (MSM), would play a leading role on that MMM-MSM alliance. In a news conference, Jugnauth said: "I'm not in agreement with the philosophy of the government and the way the country is run. When I'm not in agreement, I quit." Jugnauth's resignation would take effect on March 31, 2012 and he would be replaced on an interim basis by Vice President Monique Ohsan Bellepeau from the same party as the prime minister. For his part, Ramgoolam -- as head of the Mauritius Labor Party -- came to power following the 2010 elections, held a majority in parliament.

In July 20, 2012, the National Assembly of Mauritius was voting to officially elect a new president. To that end, Kailash Purryag -- the head of the parliament -- was elected as the new head of state of Mauritius during a special parliamentary session. Purryag was scheduled to be inaugurated into office a day later on July 21, 2012.

Parliamentary elections were scheduled to be held on Dec. 10, 2014, in Mauritius. At stake would be the composition of the unicameral National Assembly. This body is composed of 70 seats; 62 members are elected by popular vote, while eight are appointed by the election commission to give representation to various ethnic minorities. Members serve five-year terms.

The last elections were held in May 2010; thus, these December 2014 polls were being held slightly ahead of schedule. In the 2010 elections, the alliance led by Prime Minister Navin Ramgoolam secured victory over the opposition alliance of Paul Berenger.

In these 2014 elections, the main contest would be Prime Minister Ramgoolam's ruling alliance and Anerood Jugnauth's opposition alliance. The prime minister's alliance was composed of the Labor Party (MLP) and Mauritian Militant Movement (MMM), and thus known as the MLP-MMM

coalition. Jugnauth's opposition Lepep Alliance (Alliance of the People) was composed of the Militant Socialist Movement (MSM), Parti Mauricien Social Démocrate (PMSD), Mouvement Libérateur (ML), and Mouvement Démocratique National (MDN).

Note: On Dec. 10, 2014, after voters in Mauritius went to the polls and the votes were counted, it was Jugnauth's opposition Lepep alliance that claimed victory, ousting Prime Minister Ramgoolam's ruling alliance from power. The opposition alliance secured 47 of the 62 elected seats at stake, setting the path for Jugnauth to become the new prime minister.

Special Entry:

Ethnic Inclusion and Competition for Power in the Making of the Mauritian Miracle

Scholars have learned a lot in recent years about why certain ethnic groups do not get along in transitional societies. However, they still have a long way to go to understand why they do get along. Mauritius stands as a model for scholars to study how a heterogeneous society can come together to provide reasonable access to the political sphere, embracing rather than denying its diversity.

More than two-thirds of the Mauritian population derives its heritage from Indian roots. As a result, the Hindi population has long dominated public life. The advantaged Franco-Mauritian population have successfully maintained control of key cash crop sectors, especially sugar, through the years of Mauritian independence. The second largest ethnic group in Mauritius, the Creole, have struggled the most in gaining access to power.

Many scholars argue that the process of modernization will relegate the role of ethnic identification to political artifact. Experiences throughout the world appear to belie this argument however, and Mauritius is no exception. If anything, ethnic identity has grown in Mauritius along with the remarkable growth in economic opportunities.

Complicating this already plural society is the existence of multiple divisions at the sub-ethnic level. Creoles are divided between descendants of African slaves and Indo-Muslims. Ancestry and skin color add an intricate component to the intra-ethnic social rankings. Hindu society is divided along caste lines with descendants of indentured sugar plantation laborers making up about half of the population and forming an intra-ethnic underclass. With the rise of textile and technology sectors, the Hindi communities have successfully overtaken the Franco-Mauritian population as the most influential ethno-class. Yet, caste divides ensure that this impact is not uniform.

In much of Africa this sort of multitudinous division within plural societies has led to conflict. Yet, Mauritius has prospered with few threats to the ever-consolidating state. There continue to be important ethnic confrontations, most notably in February 1999. However, the institutional structure has proven that it can weather such challenges and even grow from them. The question is: why has Mauritius succeeded at meeting the needs of a heterogeneous society where other countries have failed?

Most scholars looking at the case of Mauritius focus on the unique approach of embracing difference. Civil society is strong in Mauritius, cross-cutting intra-ethnic, social and political divides. However, civic associations are commonly ethnically-based reinforcing ethnic cleavages. People embrace their identity while accepting the existence of institutions of other ethnic groups. The social sphere remains divided. Inter-ethnic marriage and even inter-ethnic socializing is uncommon. However, the communities come together in the economic sphere to power the Mauritian engine of growth.

The political sphere also embraces this marriage of difference. Mauritius is primarily based on a first-past-the-post British model. However, such a model will necessarily marginalize parts of the Creole population. It is therefore likely that the exclusionary tendencies of a rigid British model would have led to significant Creole social challenges and probable violence. For this reason, Mauritius has altered the model slightly to a consociational design in which several seats in the parliament are given out proportionately by the High Court. Marginalized Creoles benefit from these proportional seats and gain representation in the parliament and thus the formalized network of political power. There are few places where consociational democracy has worked as well as it has in Mauritius. The focus on popular elections has assured the Indian majority that they will maintain the prime ministerial position if they so desire, but ethnic minorities will be represented in government regardless.

As a result of this institutional structure, coalition governments that cross ethnic boundaries are commonplace. Political parties tend to be ethnically inclusive, but it is necessary for them and civic groups to network with other groups of other ethnicities if they wish to achieve a positive political end.

In addition to well-thought-out institutional designs, it seems that another reason for Mauritian success is that ethnic accommodation is the result of a general willingness to compromise. That is, ethnicity is embraced where it matters most, but becomes irrelevant in areas of common need, such as political access and economic growth.

A third reason for Mauritian success is likely the economic growth facilitated by this cooperation. It is much easier to encourage harmony when the growth rate exceeds six percent for an extended period of time, when there are growing opportunities, and when there is diminished competition for resources. This economic revolution has transformed society from 80 percent agrarian to eight

percent agrarian in only three decades. Per capita income now approaches \$10,000 as a result of the combined sugar and textile economies. The growing tech sector will likely drive this figure higher. Creoles have never had the advantages the Franco-Mauritian community has, and they have not gained the advantages in new sectors that the Hindi population has. However, with such growth, everyone can get an education, everyone can gain access to health care, and everyone can benefit from increased life expectancy.

The challenge Mauritius now faces is whether ethnic inclusiveness can substitute for a common ethno-national identity. When ethnic identities are challenged they have a tendency to create inter-ethnic violence in a tacit effort to raise ethnic consciousness. In order for Mauritius to avoid this fate it will have to continue to improve upon its ability to regulate public and political life by universalistic norms. It will have to continue to walk the fine line championing public sameness and private difference. If Mauritius fails at its experiment in ethno-political separation then it can foment tremendous upheaval. If it succeeds, then the institutional strength of the Mauritian government can serve to rapidly dissolve even violent conflicts.

Political Risk Index

Political Risk Index

The **Political Risk Index** is a proprietary index measuring the level of risk posed to governments, corporations, and investors, based on a myriad of political and economic factors. The [Political Risk Index](#) is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on varied criteria* including the following consideration: political stability, political representation, democratic accountability, freedom of expression, security and crime, risk of conflict, human development, jurisprudence and regulatory transparency, economic risk, foreign

investment considerations, possibility of sovereign default, and corruption. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the highest political risk, while a score of 10 marks the lowest political risk. Stated differently, countries with the lowest scores pose the greatest political risk. A score of 0 marks the most dire level of political risk and an ultimate nadir, while a score of 10 marks the lowest possible level of political risk, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater risk.

*Methodology

The [Political Risk Index](#) is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. political stability (record of peaceful transitions of power, ability of government to stay in office and carry out policies as a result of productive executive-legislative relationship, perhaps with popular support vis a vis risk of government collapse)
2. political representation (right of suffrage, free and fair elections, multi-party participation, and influence of foreign powers)
3. democratic accountability (record of respect for political rights, human rights, and civil liberties, backed by constitutional protections)
4. freedom of expression (media freedom and freedom of expression, right to dissent or express political opposition, backed by constitutional protections)
5. security and crime (the degree to which a country has security mechanisms that ensures safety of citizens and ensures law and order, without resorting to extra-judicial measures)
6. risk of conflict (the presence of conflict; record of coups or civil disturbances; threat of war; threats posed by internal or external tensions; threat or record of terrorism or insurgencies)
7. human development (quality of life; access to education; socio-economic conditions; systemic concern for the status of women and children)

8. jurisprudence and regulatory transparency (the impartiality of the legal system, the degree of transparency within the regulatory system of a country and the durability of that structure)
9. economic conditions (economic stability, investment climate, degree of nationalization of industries, property rights, labor force development)
10. corruption (the degree of corruption in a country and/or efforts by the government to address graft and other irregularities)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world.

North Korea, [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) -- retain their low rankings.

Several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), [Libya](#), [Syria](#), [Iraq](#) and [Yemen](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. The worst downgrades affected [Syria](#) where civil war is at play, along with the rampage of terror being carried out by Islamist terrorists who have also seized control over part of Syrian territory. [Iraq](#) has been further downgraded due to the rampage of Islamist terrorists and their takeover of wide swaths of Iraqi territory. [Libya](#) has also been downgraded further due to its slippage into failed state status; at issue in [Libya](#) have been an ongoing power struggle between rival militias. [Yemen](#) continues to hold steady with a poor ranking due to continued unrest at the hands of Houthi rebels, secessionists, al-Qaida in the Arabian Peninsula, and Islamic State. Its landscape has been further complicated by the fact that it is now the site of a proxy war between [Iran](#) and [Saudi Arabia](#). Conversely, [Tunisia](#) and [Egypt](#) have seen slight upgrades as these countries stabilize.

In Africa, [Zimbabwe](#) continues to be one of the bleak spots of the world with the Mugabe regime effectively destroying the country's once vibrant economy, and miring [Zimbabwe](#) with an exceedingly high rate of inflation, debilitating unemployment, devolving public services, and critical food shortages; rampant crime and political oppression round out the landscape. [Somalia](#) also sports a poor ranking due to the continuing influence of the terror group, al-Shabab, which was not operating across the border in [Kenya](#). On the upside, [Nigeria](#), which was ineffectively dealing with the threat posed by the terror group, Boko Haram, was making some strides on the national security front with its new president at the helm. [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. But the [Central African Republic](#) was downgraded due to the takeover of the

government by Muslim Seleka rebels and a continued state of lawlessness in that country. South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Burkina Faso](#), [Burundi](#) and [Guinea](#) have been downgraded due to political unrest, with [Guinea](#) also having to deal with the burgeoning Ebola crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as well as its annexation of the Ukrainian territory of Crimea. Strains on the infrastructure of southern and eastern European countries, such as [Serbia](#), [Croatia](#), and [Hungary](#), due to an influx of refugees was expected to pose social and economic challenges, and slight downgrades were made accordingly. So too, a corruption crisis for the Romanian prime minister has affected the ranking of that country. Meanwhile, the rankings for [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were maintained due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was earlier downgraded due to its sovereign debt crisis; however, no further downgrade was added since the country was able to successfully forge a bailout rescue deal with creditor institutions. Cyprus' exposure to Greek banks yielded a downgrade in its case.

In Asia, [Nepal](#) was downgraded in response to continuous political instability and a constitutional crisis that prevails well after landmark elections were held. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating. Meanwhile, [Singapore](#) retained its strong rankings due to its continued effective stewardship of the economy and political stability.

In the Americas, ongoing political and economic woes, as well as crime and corruption have affected the rankings for [Mexico](#), [Guatemala](#), and [Brazil](#). [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to its mix of market unfriendly policies and political oppression. For the moment, the [United States](#) maintains a strong ranking along with [Canada](#), and most of the English-speaking countries of the Caribbean; however, a renewed debt ceiling crisis could cause the [United States](#) to be downgraded in a future edition. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

Political Stability

Political Stability

The **Political Stability Index** is a proprietary index measuring a country's level of stability, standard of good governance, record of constitutional order, respect for human rights, and overall strength of democracy. The [Political Stability Index](#) is calculated using an established methodology* by CountryWatch's Editor-in-Chief and is based on a given country's record of peaceful transitions of power, ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse. Threats include coups, domestic violence and instability, terrorism, etc. This index measures the dynamic between the quality of a country's government and the threats that can compromise and undermine stability. Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of political stability and an ultimate nadir, while a score of 10 marks the highest level of political stability possible, according to this proprietary index. Rarely will there be scores of 0 or 10 due to the reality that countries contain complex landscapes; as such, the index offers a range of possibilities ranging from lesser to greater stability.

***Methodology**

The Political Stability Index is calculated by CountryWatch's Editor-in-Chief and is based on the combined scoring of varied criteria as follows --

1. record of peaceful transitions of power (free and fair elections; adherence to political accords)
2. record of democratic representation, presence of instruments of democracy; systemic accountability
3. respect for human rights; respect for civil rights
4. strength of the system of jurisprudence, adherence to constitutional order, and good governance

5. ability of a government to stay in office and carry out its policies vis a vis risk credible risks of government collapse (i.e. government stability versus a country being deemed "ungovernable")
6. threat of coups, insurgencies, and insurrection
7. level of unchecked crime and corruption
8. risk of terrorism and other threats to national security
9. relationship with regional powers and international community; record of bilateral or multilateral cooperation
10. degree of economic strife (i.e. economic and financial challenges)

Editor's Note:

As of 2015, the current climate of upheaval internationally -- both politically and economically -- has affected the ratings for several countries across the world. The usual suspects -- North Korea, [Afghanistan](#), and [Somalia](#) -- retain their low rankings. The reclusive and ultra-dictatorial North Korean regime, which has terrified the world with its nuclear threats, has exhibited internal instability. Of note was a cut-throat purge of hundreds of high ranking officials deemed to be a threat to Kim Jung-un. Despite their attempts to recover from years of lawlessness, war, and warlordism, both [Afghanistan](#) and [Somalia](#) continue to be beset by terrorism and turmoil. In [Afghanistan](#), while international forces have seen success in the effort against the terror group, al-Qaida, the other Islamist extremist group, the Taliban, continues to carry out a vicious insurgency using terrorism. In [Somalia](#), while the government attempts to do the nation's business, the terror group, al-Shabab continues to make its presence known not only in [Somalia](#), but across the border into [Kenya](#) with devastating results/ Also in this category is [Iraq](#), which continues to be rocked by horrific violence and terrorism at the hands of Islamic State, which has taken over wide swaths of Iraqi territory.

Syria, [Libya](#), and [Yemen](#) have been added to this unfortunate echelon of the world's most politically unstable countries. [Syria](#) has been mired by the twin hazards of 1. a civil war as rebels oppose the Assad regime; and 2. the rampage of terror being carried out by Islamic State, which also seized control over vast portions of Syrian territory. Meanwhile, the post-Qaddafi landscape of [Libya](#) has devolved into chaos as rival militias battle for control -- the elected government of the country notwithstanding. Rounding out this grim triad is [Yemen](#), which was dealing with a Houthi rebellion, secessionists in the south, as well as the threat of terrorism from al-Qaida in the Arabian Peninsula as well as Islamic State, while also being the site of a proxy war between Shi'a [Iran](#) and Sunni [Saudi Arabia](#).

Meanwhile, several Middle Eastern and North African countries, such as [Tunisia](#), [Egypt](#), and [Bahrain](#) were downgraded in recent years due to political instability occurring in the "season of unrest" sweeping the region since 2011 and continuing today. All three of these countries have stabilized in recent years and have been upgraded accordingly. In [Bahrain](#), the landscape had calmed. In [Egypt](#), the secular military-backed government has generated criticism for its crackdown on the Muslim Brotherhood; however, the country had ratified the presidency via democratic elections and were on track to hold parliamentary elections as the country moved along the path of democratization. Perhaps the most impressive story was coming out of [Tunisia](#) -- the country whose Jasmine Revolution sparked the entire Arab Spring -- and where after a few years of strife, a new progressive constitution was passed into law and a secular government had been elected to power. [Tunisia](#), [Egypt](#), and [Bahrain](#) have seen slight upgrades as these countries stabilize.

In Africa, the [Central African Republic](#) was downgraded the previous year due to the takeover of the government by Muslim Seleka rebels. Although the country has been trying to emerge from this crisis, the fact of the matter was that it was difficult to halt the precipitous decline into lawlessness in that country. [Zimbabwe](#) has maintained its consistently poor ranking due to the dictatorial regime of Mugabe, who continues to hold a tight grip on power, intimidates the opposition, squashes dissent, and oppresses the white farmer population of the country. Moving in a slightly improved direction is [Nigeria](#), which has sported abysmal ratings due to the government's fecklessness in dealing with the threat posed by the Islamist terror group, Boko Haram. Under its newly-elected government, there appears to be more of a concerted effort to make national security a priority action item. [Mali](#) was also slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Political instability has visited [Burkina Faso](#) and [Burundi](#) as the leaders of those countries attempted to side-step constitutional limits to hold onto power. In [Burundi](#), an attempted coup ensued but quelled, and the president won a (questionable) new term in office; unrest has since punctuated the landscape. In [Burkina Faso](#), the political climate has turned stormy as a result of a successful coup that ended the rule of the president, and then a putsch against the transitional government. These two African countries have been downgraded as a result.

It should be noted that the African country of South [Sudan](#) -- the world's newest nation state -- has not been officially included in this assessment; however, it can be unofficially assessed to be in the vicinity of "3" due to its manifold political and economic challenges. [Guinea](#) has endured poor rankings throughout, but was slightly downgraded further over fears of social unrest and the Ebola health crisis.

In Europe, [Ukraine](#) was downgraded due to the unrest facing that country following its Maidan revolution that triggered a pro-Russian uprising in the eastern part of the country. [Russia](#) was also implicated in the Ukrainian crisis due to its intervention on behalf of pro-Russian separatists, as

well as its annexation of the Ukrainian territory of Crimea. [Serbia](#) and [Albania](#) were slightly downgraded due to eruptions of unrest, while [Romania](#) was slightly downgraded on the basis of corruption charges against the prime minister. [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#) were downgraded due to debt woes and the concomitant effect on the euro zone. [Greece](#), another euro zone nation, was downgraded the previous year due to its sovereign debt crisis; however, the country successfully forged a rescue deal with international creditors and stayed within the Euro zone. Greek voters rewarded the hitherto unknown upstart party at the polls for these efforts. As a result, [Greece](#) was actually upgraded slightly as it proved to the world that it could endure the political and economic storms. Meanwhile, [Germany](#), [France](#), [Switzerland](#), the [United Kingdom](#), the [Netherlands](#), and the Scandinavian countries continue to post impressive ranking consistent with these countries' strong records of democracy, freedom, and peaceful transfers of power.

In Asia, [Nepal](#) was downgraded in response to continuous political instability well after landmark elections that prevails today. [Cambodia](#) was very slightly downgraded due to post-election instability that has resulted in occasional flares of violence. Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and [China](#) retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability. Increasing violence and political instability in [Pakistan](#) resulted in a downgrade for this country's already low rating.

In the Americas, [Haiti](#) retained its downgraded status due to ongoing political and economic woes. [Mexico](#) was downgraded due to its alarming rate of crime. [Guatemala](#) was downgraded due to charges of corruption, the arrest of the president, and uncertainty over the outcome of elections. [Brazil](#) was downgraded due to the corruption charges erupting on the political landscape, the stalling of the economy, and the increasingly loud calls for the impeachment of President Rousseff. [Argentina](#) was downgraded due to its default on debt following the failure of talks with bond holders. [Venezuela](#) was downgraded due to the fact that the country's post-Chavez government is every bit as autocratic and nationalistic, but even more inclined to oppress its political opponents. [Colombia](#) was upgraded slightly due to efforts aimed at securing a peace deal with the FARC insurgents. A small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States. Meanwhile, the [United States](#), [Canada](#), [Costa Rica](#), [Panama](#), and most of the English-speaking countries of the Caribbean retain their strong rankings due to their records of stability and peaceful transfers of power.

In the Pacific, [Fiji](#) was upgraded due to its return to constitutional order and democracy with the holding of the first elections in eight years.

In Oceania, [Maldives](#) has been slightly downgraded due to the government's continued and rather

relentless persecution of the country's former pro-democracy leader - former President Nasheed.

Freedom Rankings

Freedom Rankings

Freedom in the World

Editor's Note: This ranking by Freedom House quantifies political freedom and civil liberties into a single combined index on each sovereign country's level of freedom and liberty. The initials "PR" and "CL" stand for Political Rights and Civil Liberties, respectively. The number 1 represents the most free countries and the number 7 represents the least free. Several countries fall in the continuum in between. The freedom ratings reflect an overall judgment based on survey results.

Country	PR	CL	Freedom Status	Trend Arrow
Afghanistan	6 ?	6	Not Free	
Albania*	3	3	Partly Free	

Algeria	6	5	Not Free	
Andorra*	1	1	Free	
Angola	6	5	Not Free	
Antigua and Barbuda*	3 ?	2	Free	
Argentina*	2	2	Free	
Armenia	6	4	Partly Free	
Australia*	1	1	Free

Methodology:

PR and CL stand for political rights and civil liberties, respectively; 1 represents the most free and 7 the least free rating. The ratings reflect an overall judgment based on survey results.

? ? up or down indicates a change in political rights, civil liberties, or status since the last survey.

↑ ↓ up or down indicates a trend of positive or negative changes that took place but that were not sufficient to result in a change in political rights or civil liberties ratings of 1-7.

* indicates a country's status as an electoral democracy.

Human Rights

Overview of Human Rights in Mauritius

The Republic of Mauritius is a parliamentary democracy. The government works to respect the civil and human rights of its citizens. However, there were a few human rights violations reported recently. Police brutality and prison overcrowding are continuing areas of concern. Child abuse, child prostitution, and child labor have also been reported. That said, the country has a generally positive human rights record in the context of the wider international community.

*Human Development Index (HDI) is a composite index that measures the level of well-being in 177 nations in the world. It uses factors such as poverty, literacy, life-expectancy, education, gross

domestic product, and purchasing power parity to assess the average achievements in each nation. It has been used in the United Nation's Human Development Report since 1993.

*Human Poverty Index Ranking is based on certain indicators used to calculate the Human Poverty Index. Probability at birth of not surviving to age 40, adult literacy rate, population without sustainable access to an improved water source, and population below income poverty line are the indicators assessed in this measure.

*The Gini Index measures inequality based on the distribution of family income or consumption. A value of 0 represents perfect equality (income being distributed equally), and a value of 100 perfect inequality (income all going to one individual).

*The calculation of the total crime rate is the % of the total population which has been effected by property crime, robbery, sexual assault, assault, or bribery (corruption) related occurrences.

Government Functions

Constitution

The constitution went into effect in 1968 and was amended in 1992.

Executive Authority

Since March 12, 1992, the head of state has been a Mauritian-born president, replacing the British monarch, Queen Elizabeth II. Under the amended constitution, the president is elected by a simple majority of the National Assembly, for a five-year term of office.

Executive power is vested in the prime minister, who is the head of government, as well as the cabinet, which is called the Council of Ministers. The president appoints the prime minister and cabinet, but the prime minister chooses the cabinet upon recommendation. The Council of Ministers, headed by the prime minister, and consisting of other ministers as well as the leader of the majority party in the legislature, is responsible for the direction and control of the government.

Note: While the executive power remains vested in the prime minister, the elections of Sept. 11, 2000, also brought about a constitutional shift in which the prime minister's powers would be trimmed in favor of the president effective in 2004.

Legislative Authority

Legislative power is vested in the unicameral National Assembly which has up to 70 deputies. In a complex process divide, as many as eight "best losers" are chosen from the runners-up by the Electoral Supervisory Commission. The selection by the Electoral Supervisory Commission is designed to give at least minimal representation to all ethnic communities and under-represented parties. The remaining 62 seats are elected through the traditional British first-past-the-post system.

Note: The attorney general is considered to be part of the National Assembly. Elections are scheduled at least every five years.

Legal System and Judiciary

Mauritian law is an amalgam of French codes and British legal traditions. The judicial department consists of the Supreme Court, presided over by a chief justice and eight other judges who are also judges of the Court of Criminal Appeal and the Court of Civil Appeal, the Intermediate Court, the Industrial Court, and 10 district courts. At the very highest level, there is the right of appeal to the Queen's Privy Council in the United Kingdom.

Administration

Local government has nine administrative divisions, with municipal and town councils in urban areas and district and village councils in rural areas.

Head of State:

President Kailash Purryag (as of 2012). Typically, the president is head of state replacing the British monarch; the president is elected by a simple majority of the National Assembly, for a five-year term of office (eligible for a second term).

Primer on Presidential Election in Mauritius

(July 20, 2012)

An (indirect) presidential election was held in Mauritius on July 20, 2012, finally giving the country an official head of state after months of that post being held by an interim president.

In Mauritius, the president is head of state replacing the British monarch and is elected by a simple majority of the National Assembly, for a five-year term of office.

The previous election was held in on September 19, 2008, and was won by Anerood Jugnauth who initially came to power in 2003 and in that year (2008) secured re-election. On March 30, 2012, President Jugnauth officially submitted his resignation from office and said that he was joining the opposition. At issue for the outgoing president was his ongoing feud with Prime Minister Navinchandra Ramgoolam. That row was spurred by the announcement by opposition leader, Paul Berenger of the Mauritius Militant Movement (MMM), that a new opposition alliance would be formed. Jugnauth, as the founder of the Mauritius Socialist Movement (MSM), would play a leading role on that MMM-MSM alliance.

In a news conference at the time, Jugnauth said: "I'm not in agreement with the philosophy of the government and the way the country is run. When I'm not in agreement, I quit." Jugnauth's resignation took effect on March 31, 2012, and he was replaced in an interim capacity by Vice President Monique Ohsan Bellepeau from the same party as the prime minister.

Now, on July 20, 2012, the National Assembly of Mauritius was voting to officially elect a new president. To that end, Kailash Purryag -- the head of the parliament -- was elected as the new

head of state of Mauritius during a special parliamentary session. Purryag was scheduled to be inaugurated into office a day later on July 21, 2012.

Head of Government:

Prime Minister Anerood Jugnauth (since December 2014)

Note on 2014 elections:

Fresh elections held in December 2014 (see below for details). Anerood Jugnauth's opposition Lepep Alliance won the most seats and was positioned to take the reins of power.

Cabinet:

The president, on recommendation of the prime minister appoints the Council of Ministers

Legislative Branch:

Unicameral National Assembly:

70 seats; 62 members elected by popular vote, 8 appointed by the election commission to give representation to various ethnic minorities; to serve five-year terms

Primer on 2014 elections:

(Dec. 10, 2014)

Parliamentary elections were scheduled to be held on Dec. 10, 2014, in Mauritius. At stake would be the composition of the unicameral National Assembly. This body is composed of 70 seats; 62 members are elected by popular vote, while eight are appointed by the election commission to give representation to various ethnic minorities. Members serve five-year terms.

The last elections were held in May 2010; thus, these December 2014 polls were being held slightly ahead of schedule. In the 2010 elections, the alliance led by Prime Minister Navin Ramgoolam secured victory over the opposition alliance of Paul Berenger.

In these 2014 elections, the main contest would be Prime Minister Ramgoolam's ruling alliance and Anerood Jugnauth's opposition alliance. The prime minister's alliance was composed of the Labor Party (MLP) and Mauritian Militant Movement (MMM), and thus known as the MLP-MMM coalition. Jugnauth's opposition Lepep Alliance (Alliance of the People) was composed of the Militant Socialist Movement (MSM), Parti Mauricien Social Démocrate (PMSD), Mouvement Libérateur (ML), and Mouvement Démocratique National (MDN).

Note: On Dec. 10, 2014, after voters in Mauritius went to the polls and the votes were counted, it was Jugnauth's opposition Lepep alliance that claimed victory, ousting Prime Minister Ramgoolam's ruling alliance from power. The opposition alliance secured 47 of the 62 elected

seats at stake, setting the path for Jugnauth to become the new prime minister.

Judicial Branches:

Supreme Court, Court of Criminal Appeal, Court of Civil Appeal, the Intermediate Court, the Industrial Court and 10 District Courts; highest level of appeal is Queen's Privy Council

Constitution:

March 12, 1968; amended March 12, 1992

Legal System:

Based on French civil law system with elements of English common law

Administrative Divisions:

Nine districts and three dependencies*; Agalega Islands*, Black River, Cargados Carajos*, Flacq, Grand Port, Moka, Pamplemousses, Plaines Wilhems, Port Louis, Riviere du Rempart, Rodrigues*, Savanne

Purryag was scheduled to be inaugurated into office a day later on July 21, 2012.

Foreign Relations

General Relations

Strong ties between Mauritius and the West are due to Mauritius' political heritage and dependence on Western markets. Consequently, Mauritius has sought to establish close links with the European Community and its member states, particularly the United Kingdom and France, which exercises sovereignty over neighboring Reunion. Mauritius is also a member of the Commonwealth.

Foreign embassies in Mauritius include Australia, the United Kingdom, China, Egypt, France,

India, Madagascar, Pakistan, the Russian Federation and the United States.

When Mauritius became independent, the United Kingdom retained some smaller and distant islands, including Diego Garcia, which forms the southern ridge of the Maldives chain. Diego Garcia, now a British dependency, is used by the United States as a major military base. Mauritius lays claim to Diego Garcia on the basis that the islands of the Chagos archipelago were jointly administered with Mauritius until 1968.

Mauritius has close economic and political ties with South Africa and the United Kingdom.

Regional Relations

Mauritius was a leader in establishing the Indian Ocean Rim Initiative, which links Australia, India, Singapore, Oman, Kenya, South Africa, Mauritius and other Indian Ocean states. Ministers from 14 countries signed a charter for the new organization at a ministerial meeting of the IORI in Port Louis in March 1997. Paul Bérenger (then Mauritius's foreign affairs minister) was elected the first president and Mauritius agreed to house the IOR Business Center which will act as the coordinating body until a Secretariat is established.

Considered part of Africa geographically, Mauritius has a solid relationship with other African states and, in 1976, chaired the meeting of the Organization of African Unity (OAU). Overall, the government has espoused positions often promoted by developing nations. Mauritius is a member of the Southern African Development Community (SADC) and the Common Market for Eastern and Southern Africa (COMESA).

Owing to the majority ethnically Indian population, Mauritian-Indian relations are strong. This tie has played a significant role in the astounding economic growth of the island country. In 2001 this tie appears to be growing exponentially stronger. India needs Mauritius to access important U.S. and European markets. Mauritius qualifies for preferential trade status with the United States under the African Growth and Opportunity Act of 2000 as well as preferential access to the European Union Market. Mauritius is strategically located to also take advantage of both COMESA and SADC to which it holds preferential status and voting rights. Mauritius needs India for its investment capital. Combined, the countries have a significant number of educated professionals poised to govern a joint venture.

The Mauritian government paved the way in early 2001 by setting up a Board of Investment. The Indian government has worked to help pave the way for Indian business to prosper in Mauritius. In addition to established Mauritian exports of textiles, pharmaceuticals and other products, Indian companies intend to use Mauritius as a base for software development activities, data-hubs, call centers and network management centers. Ultimately, it is hoped, Mauritius will become a

"cyberisland" to the benefit of business in both countries. In a state visit in late 2000, former United States Secretary of State Madeline Albright praised the joint efforts.

Other Significant Relations

Official United States (U.S.) representation in Mauritius dates from the end of the 18th century. An American consulate was established on the island in 1794 but closed in 1911. It was reopened in 1967 and elevated to embassy status upon the country's independence in 1968. Since 1970, a resident U.S. ambassador has directed the mission.

Relations between the United States and Mauritius are good. U.S. trade with and investment in Mauritius is relatively small but growing. Most categories of Mauritian textiles, a major export, are under U.S. import restraints; Mauritius has a modest U.S. sugar quota as well.

Mauritian firms, under license, manufacture several U.S. products, including paints and chemicals. The licensing agreement, including royalties, is typically negotiated between the local firm and the foreign partner. There is no requirement for Central Bank approval. The tax on royalties was abolished in 1995.

Editor's Note

The one source of U.S.-Mauritian conflict is the Chagos archipelago mentioned above. The issue at hand is that 35 years ago the United Kingdom expelled the population of the islands, relocating them to other islands of Mauritius. They allowed the United States to build a military base there on the island of Diego Garcia. This is an important strategic base for the United States. The U.S. and United Kingdom both recognize that the island belongs to Mauritius, but the U.S. says it is a British issue because it governs the island and the British say it is an American issue because it has the military base. The Chagois people see themselves as exiles and feel that they are not getting straight answers from the British and the Americans. The British High Court ruled in December 2000 that the island belonged to the people of Chagos.

In recent negotiations, the Chagois have argued for an independent government within a Mauritian federation on the Chagois archipelago. The U.S. would give US\$6 billion in compensation for the maintenance of the base. During her visit to Mauritius in December 2000 then U.S. Secretary of State Albright expressed "appreciation" for the usage of Diego Garcia and her "concern" for the issue, promising to "take the issue back" to Washington, D.C. Most importantly, she recognized the sovereignty of the island. However, in light of the change of U.S. administrations it is unlikely that any effort will be forthcoming to resolve the dispute.

In April 2006, about one hundred former residents of the Chagos Archipelago, which has been claimed by Mauritius as part of its sovereign territory, returned after four decades of living elsewhere. They had been evicted by the United Kingdom because of plans to establish a United States military base on the island of Diego Garcia. Their eviction had sparked a lengthy legal battle over their right to return home. Finally, in May 2007, the Court of Appeal in the United Kingdom ruled that the Chagos Islands exiles had the right of return to their home.

National Security

External Threats

Mauritius does not face any imminent threats from other countries. It is involved in two minor territorial disputes with former colonial rulers, however. Mauritius continues to assert claims to the British-administered Chagos Archipelago, as well as the French-administered Tromelin Island.

Crime

The level of criminal activity in Mauritius is generally low. Although violent crimes are uncommon, petty crime is increasingly becoming a problem. Residential break-ins are an issue as well.

Mauritius serves as a minor transshipment point for South Asian heroin. Likewise, small amounts of cannabis are cultivated there, mostly for the domestic market. A substantial offshore financial services industry renders Mauritius vulnerable to money laundering. A generally low level of corruption and a commitment on the part of its government to oversight have served to assuage the risk of illicit financial activity, however.

Insurgencies

No insurgent movements threaten Mauritius. Though its population represents an amalgam of diverse traditions, Mauritius has enjoyed generally stable political conditions since it attained its independence from Britain in 1968. The bulk of its inhabitants are of South Asian ancestry, but there is also a substantial Creole population in Mauritius, as well as ethnic Chinese and European minorities. Roughly half of the residents are Hindu, approximately 28 percent are Christian and just over 16 percent practice Islam. Elements of the nation's Hindu and Muslim populations have coalesced into political parties. For the most part, however, Mauritius has been free of ethnic and religious tension. There are a couple of notable exceptions. The 1999 death of Mauritian-Creole singer Joseph Topize in police custody prompted members of the island's Creole population to riot. Likewise, a recent downturn in the local economy brought on by inclement weather and declining global sugar prices prompted members of the Creole community to protest over their comparatively lower standard of living.

Terrorism

There is no specific threat of terrorism against Mauritius, nor has it traditionally been the target of terrorist violence. It has however been active, though on a small scale, in the war against terrorism. Mauritius's security forces are receiving training from the United States in counter-terrorism methods. It is also working in conjunction with Madagascar to help combat the problem of drug-trafficking as well.

Mauritius is party to six of the twelve international conventions and protocols pertaining to terrorism.

Economic Overview

Economic Overview

Overview

Mauritius is an island country with a population of 1.34 million (CIA, 2015). The country has a reputation for stability and racial harmony among its mixed population of Asians, Europeans and Africans. Mauritius has achieved remarkable economic success since its independence in 1968, with one of the highest per capita incomes (US\$18,600, CIA, 2014) in Africa. The achievement has been underpinned by macroeconomic and political stability, an efficient administration, a favorable regulatory environment, and a well-developed financial system. In the face of major external shocks, namely the phasing out of the Multi-Fiber Agreement and sharp reductions in EU sugar prices, the government launched wide-ranging reforms in 2005, including liberalization of trade and investment, lifting some price controls, the reduction of taxes, and fiscal consolidation. The reforms led to higher GDP growth, a declining fiscal deficit, and rising foreign direct investment (FDI).

Like other emerging market economies, Mauritius' economy was adversely affected by the current global economic crisis through weakening external demand for textiles and tourism. The government responded to the crisis with prompt and comprehensive policy adjustments, including a fiscal stimulus package and monetary easing. The stimulus package was well-targeted and temporary, having been instrumental in cushioning the economy against the impact of the global crisis. . Mauritius' sound economic policies and prudent banking practices helped offset negative effects from the global financial crisis. For its post-crisis strategy, the key challenge for the government has been to resume fiscal consolidation without jeopardizing the recovery. GDP growth was positive in 2010 and the country continues to expand its trade and investment outreach around the globe. In October 2011, the IMF opened a new southern African technical assistance center in Mauritius. It was the eighth center of its kind set up by IMF around the world, and the fourth in Africa, to transfer economic skills and best practices as well as to train officials in an effort to build countries' policymaking capacity. Overall, the Mauritian economy continued its recovery in 2011, but growth momentum had slowed by March 2012 due to the adverse external environment. In July 2012, Kailash Purryag was sworn in as the new president of Mauritius after Sir Anerood Jugnauth submitted his resignation in March.

Overall, the Mauritian economy has held up well against the persistent global economic turbulence, although its growth momentum slowed a bit in 2012 compared to the year prior. Forecasts for 2013 and 2014 showed a gradual recovery with growth rates rising in each year.

Mauritius' economy grew 2.8 percent in the first quarter of 2014, representing the country's worst first quarter performance in five years. However, the central bank said it expected growth would pick up in the second half of the year because of improving economic conditions with Mauritius's main trading partners. In late September 2014, Mauritius said it expected its unemployment rate to fall slightly for the year compared to 2013. Meanwhile, business confidence in Mauritius hit a record low in the third quarter of 2014 due to a decline in domestic demand, according to a survey of leading private sector companies cited by Reuters. Around the same time, the Bank of Mauritius cut its 2014 economic growth forecast to 3.4 to 3.6 percent from its April projection of a 3.7 to 4 percent expansion.

In late July 2015, Reuters reported that Mauritius' economy was expected to expand by 4.6 percent in 2016 after growing 3.7 percent in 2015, while inflation could rise in the same period, according to the Bank of Mauritius. Then in August 2015, Reuters reported that business confidence on Mauritius rose slightly in the second quarter.

Economic Performance

Following strong growth from 2006 to 2008, real GDP slowed sharply in 2009 with contractions in tourism, textiles and construction, as a result of the global economic crisis. It climbed slightly in 2010 and 2011.

According to CountryWatch estimated calculations for 2014:

Real GDP growth rate was: 4.1 percent

The fiscal deficit/surplus as percent of GDP (%) was: -0.6 percent

Inflation was measured at: 3.8 percent

Updated in 2015

Economic Performance Index

Economic Performance Index

The Economic Performance rankings are calculated by CountryWatch's editorial team, and are based on criteria including sustained economic growth, monetary stability, current account deficits, budget surplus, unemployment and structural imbalances. Scores are assessed from 0 to 100 using this aforementioned criteria as well as CountryWatch's proprietary economic research data and models.

Chapter 4

Investment Overview

Foreign Investment Climate

Background

Since independence in 1968, Mauritius has developed from a low-income, agriculturally based economy to a middle-income diversified economy with growing industrial, financial, and tourist sectors. For most of the period, annual growth has been in the order of 5% to 6%. This remarkable achievement has been reflected in more equitable income distribution, increased life expectancy, lowered infant mortality, and a much-improved infrastructure. The economy rests on sugar, tourism, textiles and apparel, and financial services, and is expanding into fish processing, information and communications technology, and hospitality and property development. Sugarcane is grown on about 90% of the cultivated land area and accounts for 15% of export earnings. The government's development strategy centers on creating vertical and horizontal clusters of development in these sectors. Mauritius has attracted more than 32,000 offshore entities, many aimed at commerce in India, South Africa, and China. Investment in the banking sector alone has reached over \$1 billion. Mauritius, with its strong textile sector, has been well poised to take advantage of the Africa Growth and Opportunity Act (AGOA).

Foreign Investment Assessment

Openness to Foreign Investment

The government welcomes foreign investment, especially export-oriented industries. Tax concessions and other incentives, introduced in 1970 to attract manufacturers to the export processing zone, have since been extended to services and to companies in the Mauritius Freeport and the offshore banking and business center. The Mauritius Export Development and Investment Authority was established in 1984 to assist investors and promote exports.

Foreign direct investment is governed by the provisions of the Non-Citizen (Property Restriction) Act 1975. The government has notified the WTO it does not maintain any measures prohibited under the Agreement on Trade Related Investment Measures (TRIMS).

Transparency of Regulatory System

Business regulations are generally transparent. Applications for incentives certificates are screened by a committee chaired by the Ministry of Industry and composed of representatives of other

ministries and government agencies. After committee consideration, the application is sent to Cabinet for decision.

Decision on a formal application usually takes six weeks. Approval for an Offshore or Freeport License normally is done within two weeks as they are approved directly by the Mauritius Offshore and Business Activities Authority and the Mauritius Freeport Authority, respectively and do not require Cabinet approval.

Most foreign firms starting business in Mauritius use existing buildings offered by government agencies or private owners. Those who build their own facilities may face delays of six months obtaining permits for utilities. With regard to work permits, operators have sometimes faced delays of up to three months in obtaining permits for groups of foreign workers. Permits for professionals are normally processed within one month; attention must be given to filling out all forms completely.

Labor Force

Total: 560,000

By occupation: agriculture and fishing 14%, construction and industry 36%, transportation and communication 7%, trade, restaurants, hotels 16%, finance 3%, other services 24%

Agriculture and Industry

Agriculture products: sugarcane, tea, corn, potatoes, bananas, pulses; cattle, goats; fish

Industries: food processing (largely sugar milling), textiles, clothing; chemicals, metal products, transport equipment, non-electrical machinery; tourism

Import Commodities and Partners

Commodities: manufactured goods, capital equipment, foodstuffs, petroleum products, chemicals

Partners: South Africa 12.1%, France 12%, China 8.4%, India 8.2%

Export Commodities and Partners

Commodities: clothing and textiles, sugar, cut flowers, molasses

Partners: UK 31%, France 21.4%, US 17.5%, Madagascar 6.3%

Telephone System

Telephones- main lines in use: 348,200

Telephones- mobile cellular: 462,400

General Assessment: small system with good service

Domestic: primarily microwave radio relay trunk system

International: country code - 230; satellite earth station - 1 Intelsat (Indian Ocean); new microwave link to Reunion; HF radiotelephone links to several countries; fiber optic submarine cable (SAT-3/WASC/SAFE) provides connectivity to Europe and Asia

Internet

Internet Hosts: 3,985

Internet users: 150,000

Roads, Airports, Ports and Harbors

Highways: 2,000 km

Ports and harbors: Port Louis

Airports: 6; w/paved runways: 2

Legal System and Considerations

Mauritius' legal system is based on French civil law system with elements of English common law in certain areas.

Dispute Settlement

The embassy is not aware of any investment disputes. Mauritius is signatory to the U.N.-sponsored Convention on Settlement of Investment Disputes, the 1958 New York Convention on the Recognition or Enforcement of Foreign Arbitral Awards, and the Multilateral Investment Guarantee Agency (MIGA) of World Bank.

The domestic legal system is generally open, non-discriminatory and transparent. Members of the judiciary are independent of the legislature and the government. The highest court of appeal is the Judicial Committee of the Privy Council of the United Kingdom. Mauritius is a member of the International Court of Justice

Corruption Perception Ranking

See listing by Transparency International elsewhere in this report for Mauritius' most recent ranking; typically, Mauritius is ranked as one of the less corrupt countries.

Cultural Considerations

In Mauritius, as in all other Muslim or Hindu cultures, it is important to respect and observe their traditions and practices. For example, one should never give, take or eat anything with the left hand as the left hand is considered taboo.

For More information see:

United States' State Department Commercial Guide

Foreign Investment Index

Foreign Investment Index

The Foreign Investment Index is a proprietary index measuring attractiveness to international investment flows. The Foreign Investment Index is calculated using an established methodology by CountryWatch's Editor-in-Chief and is based on a given country's economic stability (sustained economic growth, monetary stability, current account deficits, budget surplus), economic risk (risk of non-servicing of payments for goods or services, loans and trade-related finance, risk of sovereign default), business and investment climate (property rights, labor force and laws, regulatory transparency, openness to foreign investment, market conditions, and stability of government). Scores are assigned from 0-10 using the aforementioned criteria. A score of 0 marks the lowest level of foreign investment viability, while a score of 10 marks the highest level of foreign investment viability, according to this proprietary index.

Zimbabwe	3.5

Editor's Note:

As of 2015, the global economic crisis (emerging in 2008) had affected many countries across the

world, resulting in changes to their rankings. Among those countries affected were top tier economies, such as the [United Kingdom](#), [Iceland](#), [Switzerland](#) and [Austria](#). However, in all these cases, their rankings have moved back upward in the last couple of years as anxieties have eased. Other top tier countries, such as [Spain](#), [Portugal](#), [Ireland](#), and [Italy](#), suffered some effects due to debt woes and the concomitant effect on the euro zone. Greece, another euro zone nation, was also downgraded due to its sovereign debt crisis; however, Greece's position on the precipice of default incurred a sharper downgrade than the other four euro zone countries mentioned above. Cyprus' exposure to Greek bank yielded a downgrade in its case. Slovenia and [Latvia](#) have been slightly downgraded due to a mix of economic and political concerns but could easily be upgraded in a future assessment, should these concerns abate. Meanwhile, the crisis in eastern [Ukraine](#) fueled downgrades in that country and neighboring [Russia](#).

Despite the "trifecta of tragedy" in [Japan](#) in 2011 -- the earthquake, the ensuing tsunami, and the resulting nuclear crisis -- and the appreciable destabilization of the economic and political terrain therein, this country has only slightly been downgraded. Japan's challenges have been assessed to be transient, the government remains accountable, and there is little risk of default. Both [India](#) and China retain their rankings; [India](#) holds a slightly higher ranking than [China](#) due to its record of democratic representation and accountability.

There were shifts in opposite directions for [Mali](#) and [Nigeria](#) versus the [Central African Republic](#), [Burkina Faso](#), and [Burundi](#). [Mali](#) was slightly upgraded due to its efforts to return to constitutional order following the 2012 coup and to neutralize the threat of separatists and Islamists. Likewise, a new government in [Nigeria](#) generated a slight upgrade as the country attempts to confront corruption, crime, and terrorism. But the [Central African Republic](#) was downgraded due to the takeover of the government by Seleka rebels and the continued decline into lawlessness in that country. Likewise, the attempts by the leaders of [Burundi](#) and [Burkina Faso](#) to hold onto power by by-passing the constitution raised eyebrows and resulted in downgrades.

Political unrest in [Libya](#) and [Algeria](#) have contributed to a decision to marginally downgrade these countries as well. [Syria](#) incurred a sharper downgrade due to the devolution into de facto civil war and the dire security threat posed by Islamist terrorists. [Iraq](#) saw a similar downgrade as a result of the takeover of wide swaths of territory and the threat of genocide at the hands of Islamist terrorists. [Yemen](#), likewise, has been downgraded due to political instability at the hands of secessionists, terrorists, Houthi rebels, and the intervention of external parties. Conversely, [Egypt](#) and [Tunisia](#) saw slight upgrades as their political environments stabilize.

At the low end of the spectrum, devolving security conditions and/or economic crisis have resulted in countries like [Pakistan](#), [Afghanistan](#), [Somalia](#), and [Zimbabwe](#) maintaining their low ratings.

The [United States](#) continues to retain its previous slight downgrade due to the enduring threat of default surrounding the debt ceiling in that country, matched by a conflict-ridden political climate.

In the case of [Mexico](#), there is limited concern about default, but increasing alarm over the security situation in that country and the government's ability to contain it. In [Argentina](#), a default to bond holders resulted in a downgrade to that country. Finally, a small but significant upgrade was attributed to [Cuba](#) due to its recent pro-business reforms and its normalization of ties with the United States.

Corruption Perceptions Index

Corruption Perceptions Index

Transparency International: [Corruption Perceptions Index](#)

Editor's Note:

Transparency International's [Corruption Perceptions Index](#) is a composite index which ranks countries in terms of the degree to which corruption is perceived to exist among public officials. This index indicates the views of national and international business people and analysts about the levels of corruption in each country. The highest (and best) level of transparency is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

178	Myanmar	1.4	3	0.9 - 1.8
179	Afghanistan	1.3	4	1.0 - 1.5
180	Somalia	1.1	3	0.9 - 1.4

Methodology:

As noted above, the highest (and best) level of transparency with the least perceived corruption is indicated by the number, 10. The lower (and worse) levels of transparency are indicated by lower numbers.

According to Transparency International, the [Corruption Perceptions Index](#) (CPI) table shows a country's ranking and score, the number of surveys used to determine the score, and the confidence range of the scoring.

The rank shows how one country compares to others included in the index. The CPI score indicates the perceived level of public-sector corruption in a country/territory.

The CPI is based on 13 independent surveys. However, not all surveys include all countries. The surveys used column indicates how many surveys were relied upon to determine the score for that country.

The confidence range indicates the reliability of the CPI scores and tells us that allowing for a margin of error, we can be 90% confident that the true score for this country lies within this range.

Note:

Kosovo, which separated from the Yugoslav successor state of [Serbia](#), is not listed above. No calculation is available for [Kosovo](#) at this time, however, a future corruption index by Transparency International may include the world's newest country in its tally. Taiwan has been listed above despite its contested status; while Taiwan claims sovereign status, [China](#) claims ultimate jurisdiction over Taiwan. Hong Kong, which is also under the rubric of Chinese sovereignty, is listed above. Note as well that Puerto Rico, which is a [United States](#) domain, is also included in the list above. These inclusions likely have to do with the size and fairly autonomous status of their economies.

Competitiveness Ranking

Competitiveness Ranking

Editor's Note:

The Global Competitiveness Report's competitiveness ranking is based on the Global Competitiveness Index (GCI), which was developed for the World Economic Forum. The GCI is based on a number of competitiveness considerations, and provides a comprehensive picture of the competitiveness landscape in countries around the world. The competitiveness considerations are: institutions, infrastructure, macroeconomic environment, health and primary education, higher education and training, goods market efficiency, labour market efficiency, financial market development, technological readiness, market size, business sophistication, and innovation. The rankings are calculated from both publicly available data and the Executive Opinion Survey.

Country/Economy	GCI 2010 Rank	GCI 2010 Score	GCI 2009 Rank	Change 2009-2010
Switzerland	1	5.63	1	0
Sweden	2	5.56	4	2

Angola	138	2.93	n/a	n/a
Chad	139	2.73	131	-8

Methodology:

The competitiveness rankings are calculated from both publicly available data and the Executive Opinion Survey, a comprehensive annual survey conducted by the World Economic Forum together with its network of Partner Institutes (leading research institutes and business organizations) in the countries covered by the Report.

Highlights according to WEF --

- The [United States](#) falls two places to fourth position, overtaken by [Sweden](#) and [Singapore](#) in the rankings of the World Economic Forum's Global Competitiveness Report 2010-2011
- The People's Republic of [China](#) continues to move up the rankings, with marked improvements in several other Asian countries
- [Germany](#) moves up two places to fifth place, leading the Eurozone countries
- [Switzerland](#) tops the rankings

Updated:

2011 using most recent ranking available; reviewed in 2015.

Taxation

Corporate tax

Corporate income tax is applied at 15 percent on taxable income.

Social security

Social security contributions are applied at six percent on gross salaries.

Value added tax

Value added tax (VAT) is applied at 15 percent on most transactions.

Stock Market

The Stock Exchange of Mauritius, which opened in 1989, has 41 listed companies. It is considered as one of the most advanced and active stock market in Sub-Saharan Africa.

The SEM-7 provides a benchmark for local and foreign market participants. The SEM-7 is comprised of the seven largest eligible shares of the official list, measured in terms of market capitalization, liquidity and investibility.

Foreign investors do not need approval to trade shares on the official market, with two stipulations: individual holdings in a sugar company of 15 percent or more need prior authorization, and investment for the purpose of obtaining legal or management control of a local company is barred.

The Stock Exchange established a computerized depository system. Trades are now settled on a rolling t+5 basis; plans are to improve to t+3 international standard.

Chapter 5

Social Overview

People

Population

Of the population numbering 1.3 million (including Rodrigues and other dependencies), population density is high. There is a birth rate of 15.26 per 1,000, a fertility rate of 1.94 children born per woman, and a population growth rate of 0.798 percent per annum.

Ethnicity

Mauritius' diverse ethnic makeup is the product of its past as a sugar producing colony. Members of Mauritius' Creole population are descendants of African slaves and European plantation owners. The dominant Indo-Mauritian community traces its roots to laborers who replaced the Africans in the cane fields after slavery was abolished. These include people who came from both present-day India as well as present-day Pakistan. There are a small number of people of Chinese descent, referred to as Sino-Mauritians and a small Franco-Mauritian population.

Ethnicity and Power

Franco-Mauritians compose the nation's elite and historically held political power. For many years, their power base was supported by the Creoles. The Franco-Mauritian elite controls nearly all of the large sugar estates, and they continue to be active in business and banking. Its hold over state authority has decreased, however. As the Indian population grew and the voting franchise was extended, political power shifted from the Franco-Mauritians and their Creole allies, to the Indian community.

While there have been significant conflicts between the diverse Mauritian ethnicities, in recent years the growing state has successfully incorporated the plurality into the functioning of the state. Civic institutions, the public service and the business sector have all begun reflecting this diversification of the bases of power and opportunity. Nonetheless, this inclusiveness appears to have come at the cost of proportionality. Mauritius appears to be becoming a society built on separate but equal ethnic access to political, social and economic processes.

Language

English is the official language, but French is still widely spoken. In government, the authorized language of address is English, but any member of the National Assembly may address the speaker in French. The most widely spoken language is Mauritian Creole, which is derived primarily from French. In addition, other secondary languages are spoken, such as Hindi, Urdu, Bojoori, Hakka and Tamil. Among the Indian population, Bojoori is reportedly the most commonly spoken language.

Religion

Religious affiliation is similarly varied and includes followers of Christianity, Hinduism and Islam. Because the majority of the Mauritian population (68 percent) is of Indian ancestry, Hinduism is practiced by more than half the population (52 percent), while Islam is practiced by 16 percent of the population. Christians make up about 28 percent of the population, with Roman Catholics making up the vast majority of the Christians.

Health and Welfare

Life expectancy is relatively high at 73.75 years (77.4 for women and 70.26 for men). The literacy rate for the population age 15 and over is 85 percent. With less than one percent of the population testing HIV positive, Mauritius has not faced the HIV/AIDS the crisis of many of its regional partners. The literacy rate is 84.4 percent, with males seeing a higher rate of 88.4 percent, relative to the 80.5 percent for females.

Education expenditures in the country amount to 3.2 percent of GDP. Health expenditures in this country amount to 6.5 percent of GDP. Availability of drinkable water is very good; access to sanitation facilities is also very good.

Human Development

One notable measure used to determine a country's quality of life is the Human Development Index (HDI), which has been compiled annually since 1990 by the United Nations Development Programme (UNDP). The HDI is a composite of several indicators, which measure a country's achievements in three main arenas of human development: longevity, knowledge and education, as well as economic standard of living. In a recent ranking of 169 countries and territories, the HDI

placed Mauritius in the high human development category, at 72nd place.

Although the concept of human development is complicated and cannot be properly captured by values and indices, the HDI, which is calculated and updated annually, offers a wide-ranging assessment of human development in certain countries, not based solely upon traditional economic and financial indicators.

Written by Dr. Denise Youngblood Coleman, Editor in Chief, www.countrywatch.com; see Bibliography for research sources.

Human Development Index

Human Development Index

Human Development Index (Ranked Numerically)

The [Human Development Index](#) (HDI) is used to measure quality of life in countries across the world. The HDI has been compiled since 1990 by the United Nations Development Programme (UNDP) on a regular basis. The HDI is a composite of several indicators, which measure a country's achievements in three main arenas of human development: longevity, education, and economic standard of living. Although the concept of human development is complicated and cannot be properly captured by values and indices, the HDI offers a wide-ranging assessment of human development in certain countries, not based solely upon traditional economic and financial indicators. For more information about the methodology used to calculate the HDI, please see the "Source Materials" in the appendices of this review.

Very High Human Development	High Human Development	Medium Human Development	Low Human Development

Life Satisfaction Index

Life Satisfaction Index

Life Satisfaction Index

Created by Adrian G. White, an Analytic Social Psychologist at the University of Leicester, the "Satisfaction with Life Index" measures subjective life satisfaction across various countries. The data was taken from a metastudy (see below for source) and associates the notion of subjective happiness or life satisfaction with qualitative parameters such as health, wealth, and access to basic education. This assessment serves as an alternative to other measures of happiness that tend to rely on traditional and quantitative measures of policy on quality of life, such as GNP and GDP. The methodology involved the responses of 80,000 people across the globe.

178	Burundi	100

Commentary:

European countries, such as [Denmark](#), [Iceland](#), [Finland](#), [Sweden](#), [Switzerland](#), [Austria](#) resided at the top of the ranking with highest levels of self-reported life satisfaction. Conversely, European countries such as [Latvia](#), [Lithuania](#), [Moldova](#), [Belarus](#) and [Ukraine](#) ranked low on the index. African countries such as Democratic Republic of Congo, [Zimbabwe](#) and [Burundi](#) found themselves at the very bottom of the ranking, and indeed, very few African countries could be found in the top 100. [Japan](#) was at the mid-way point in the ranking, however, other Asian countries such as [Brunei](#) and [Malaysia](#) were in the top tier, while [Pakistan](#) was close to the bottom with a low level of self-identified life satisfaction. As a region, the Middle East presented a mixed bag with Saudi Arabians reporting healthy levels of life satisfaction and Egyptians near the bottom of the ranking. As a region, Caribbean countries were ranked highly, consistently demonstrating high levels of life satisfaction. The findings showed that health was the most crucial determining factor in life satisfaction, followed by prosperity and education.

Happy Planet Index

Happy Planet Index

The Happy Planet Index (HPI) is used to measure human well-being in conjunction with environmental impact. The HPI has been compiled since 2006 by the New Economics Foundation. The index is a composite of several indicators including subjective life satisfaction, life expectancy at birth, and ecological footprint per capita.

As noted by NEFA, the HPI "reveals the ecological efficiency with which human well-being is delivered." Indeed, the index combines environmental impact with human well-being to measure the environmental efficiency with which, country by country, people live long and happy lives. The countries ranked highest by the HPI are not necessarily the ones with the happiest people overall, but the ones that allow their citizens to live long and fulfilling lives, without negatively impacting this opportunity for either future generations or citizens of other countries. Accordingly, a country like the [United States](#) will rank low on this list due to its large per capital ecological footprint, which uses more than its fair share of resources, and will likely cause planetary damage.

It should be noted that the HPI was designed to be a counterpoint to other well-established indices of countries' development, such as Gross Domestic Product (GDP), which measures overall national wealth and economic development, but often obfuscates the realities of countries with stark variances between the rich and the poor. Moreover, the objective of most of the world's people is not to be wealthy but to be happy. The HPI also differs from the [Human Development Index](#) (HDI), which measures quality of life but not ecology, since it [HPI] also includes sustainability as a key indicator.

Year Women Received the Right to Stand for Election:

1956

*The Gender Development Index (GDI) is a composite index which measures the average achievement in a country. While very similar to the Human Development Index in its use of the same variables, the GDI adjusts the average achievement of each country in terms of life expectancy, enrollment in schools, income, and literacy in accordance to the disparities between males and females.

*The Gender Empowerment Measure (GEM) is a composite index measuring gender inequality in three of the basic dimensions of empowerment; economic participation and decision-making, political participation and decision-making, and power over economic resources.

*Total Fertility Rate (TFR) is defined as the average number of babies born to women during their reproductive years. A TFR of 2.1 is considered the replacement rate; once a TFR of a population reaches 2.1 the population will remain stable assuming no immigration or emigration takes place. When the TFR is greater than 2.1 a population will increase and when it is less than 2.1 a population will eventually decrease, although due to the age structure of a population it will take years before a low TFR is translated into lower population.

*Maternal Mortality Rate is the number of deaths to women per 100,000 live births that resulted from conditions related to pregnancy and or delivery related complications.

*Economically Active Females are the share of the female population, ages 15 and above, whom supply, or are able to supply, labor for the production of goods and services.

*Female Contributing Family Workers are those females who work without pay in an economic enterprise operated by a relative living in the same household.

*Estimated Earned Income is measured according to Purchasing Power Parity (PPP) in US dollars.

Global Gender Gap Index

Global Gender Gap Index

Editor's Note:

The Global Gender Gap Index by the World Economic Forum ranks most of the world's countries in terms of the division of resources and opportunities among males and females. Specifically, the ranking assesses the gender inequality gap in these four arenas:

1. Economic participation and opportunity (salaries and high skilled employment participation levels)
2. Educational attainment (access to basic and higher level education)
3. Political empowerment (representation in decision-making structures)
4. Health and survival (life expectancy and sex ratio)

*new country 2010

Commentary:

According to the report's index, Nordic countries, such as [Iceland](#), [Norway](#), [Finland](#), and [Sweden](#) have continued to dominate at the top of the ranking for gender equality. Meanwhile, [France](#) has seen a notable decline in the ranking, largely as a result of decreased number of women holding ministerial portfolios in that country. In the Americas, the [United States](#) has risen in the ranking to top the region, predominantly as a result of a decreasing wage gap, as well as higher number of women holding key positions in the current Obama administration. [Canada](#) has continued to remain as one of the top ranking countries of the Americas, followed by the small Caribbean island nation of Trinidad and Tobago, which has the distinction of being among the top three countries of the Americans in the realm of gender equality. [Lesotho](#) and South African ranked highly in the

index, leading not only among African countries but also in global context. Despite [Lesotho](#) still lagging in the area of life expectancy, its high ranking was attributed to high levels of female participation in the labor force and female literacy. The [Philippines](#) and [Sri Lanka](#) were the top ranking countries for gender equality for Asia, ranking highly also in global context. The [Philippines](#) has continued to show strong performance in all strong performance on all four dimensions (detailed above) of the index. Finally, in the Arab world, the [United Arab Emirates](#) held the highest-rank within that region of the world; however, its placement near the bottom of the global list highlights the fact that Arab countries are generally poor performers when it comes to the matter of gender equality in global scope.

Etiquette

Cultural Dos and Taboos

1. Men and women should dress modestly only wearing swimwear at the beach or pool.

2. Men and women should not display affection with each other publicly. In general, flirting with a Hindu or Muslim is a not tolerated.
3. One should remove his or her shoes before entering the house of a Hindu or Muslim.
4. One should haggle in the marketplace.
5. If one is entertaining a Hindu do not serve beef.
6. If one is entertaining a Muslim do not offer pork or alcohol.

Travel Information

Please Note

This is a generalized travel guide and it is intended to coalesce several resources, which a traveler might find useful, regardless of a particular destination. As such, it does not include travel warnings for specific "hot spot" destinations.

For travel alerts and warnings, please see the United States Department of State's listings available at URL:

<http://travel.state.gov/content/passports/english/alertswarnings.html>

Please note that travel to the following countries, based on these warnings, is ill-advised, or should be undertaken with the utmost precaution:

Afghanistan, Algeria, Burundi, Cameroon, Central African Republic, Chad, Colombia, Democratic Republic of Congo, Djibouti, El Salvador, Eritrea, Ethiopia, Guinea, Honduras, Iraq, Iran, Lebanon, Liberia, Libya, Mali, Mauritania, Mexico, Nepal, Niger, Nigeria, North Korea, Pakistan, Palestinian Territories of West Bank and Gaza, Philippines areas of Sulu Archipelago, Mindanao, and southern Sulu Sea, Saudi Arabia, Sierra Leone, Somalia, South Sudan, Sudan, Syria, Ukraine, Venezuela, and Yemen.

International Travel Guide

Checklist for Travelers

1. Take out travel insurance to cover hospital treatment or medical evacuation. Overseas medical costs are expensive to most international travelers, where one's domestic, nationalized or even private health insurance plans will not provide coverage outside one's home country. Learn about "reciprocal insurance plans" that some international health care companies might offer.
2. Make sure that one's travel insurance is appropriate. If one intends to indulge in adventurous activities, such as parasailing, one should be sure that one is fully insured in such cases. Many traditional insurance policies do not provide coverage in cases of extreme circumstances.
3. Take time to learn about one's destination country and culture. Read and learn about the place one is traveling. Also check political, economic and socio-cultural developments at the destination by reading country-specific travel reports and fact sheets noted below.
4. Get the necessary visas for the country (or countries) one intends to visit - but be aware that a visa does not guarantee entry. A number of useful sites regarding visa and other entry requirements are noted below.
5. Keep in regular contact with friends and relatives back at home by phone or email, and be sure to leave a travel itinerary.
6. Protect one's personal information by making copies of one's passport details, insurance policy, travelers checks and credit card numbers. Taking copies of such documents with you, while leaving another collection copies with someone at home is also good practice for travelers. Taking copies of one's passport photograph is also recommended.
7. Stay healthy by taking all possible precautions against illness. Also, be sure to take extra supplies of prescription drugs along for the trip, while also taking time to pack general pharmaceutical supplies, such as aspirin and other such painkillers, bandages, stomach ailment medication, anti-inflammatory medication and anti-bacterial medication.
8. Do not carry illicit drugs. Understand that the punishment for possession or use of illegal drugs in some countries may be capital punishment. Make sure your prescription drugs are legal in the countries you plan to visit.
9. Know the laws of one's destination country and culture; be sure to understand the repercussions of breaking those laws and regulations. Often the transparency and freedoms of the juridical system at home is not consistent with that of one's destination country. Become aware of these complexities and subtleties before you travel.
10. For longer stays in a country, or where the security situation is volatile, one should register one's self and traveling companions at the local embassy or consulate of one's country of citizenship.
11. Women should take care to be prepared both culturally and practically for traveling in a different country and culture. One should be sure to take sufficient supplies of personal feminine products and prescription drugs. One should also learn about local cultural standards for women, including norms of dressing. Be aware that it is simply inappropriate and unsafe for women to travel alone in some countries, and take the necessary precautions to avoid risk-filled situations.
12. If one is traveling with small children, one should pack extra supplies, make arrangements with the travel carrier for proper seating that would adequately accommodate children, infants or

toddlers. Note also that whether one is male or female, traveling with children means that one's hands are thus not free to carry luggage and bags. Be especially aware that this makes one vulnerable to pickpockets, thieves and other sorts of crime.

13. Make proper arrangements for accommodations, well in advance of one's arrival at a destination. Some countries have limited accommodation, while others may have culturally distinctive facilities. Learning about these practicalities before one travels will greatly aid the enjoyment of one's trip.

14. Travel with different forms of currency and money (cash, traveler's checks and credit cards) in anticipation that venues may not accept one or another form of money. Also, ensuring that one's financial resources are not contained in one location, or by one person (if one is traveling with others) can be a useful measure, in the event that one loses a wallet or purse.

15. Find out about transportation in the destination country. In some places, it might be advisable to hire a local driver or taxi guide for safety reasons, while in other countries, enjoying one's travel experience may well be enhanced by renting a vehicle and seeing the local sights and culture independently. Costs may also be prohibitive for either of these choices, so again, prior planning is suggested.

Tips for Travelers

- Get the best travel insurance deal possible.
- Check with your embassy, consulate, or appropriate government institution related to travel before traveling.
- Some prescription drugs are not allowed in Mauritius.
- Bring enough money for all contingencies.
- Keep valuable effects in a safe place.
- Enter next of kin details into the back of your passport.
- Beware of pickpockets and, on foot, stay away from dark quiet streets.
- Carry a photocopy of your passport with you, not the original.
- Accommodation must be specified on arrival at Mauritian ports.
- Find out the appropriate amount of time visitors are allowed to stay in Mauritius. Do not overstay this period without obtaining permission from the Passport & Immigration Office.

- Wear beach shoes and be alert to speeding boats inside the reef.
- Don't pack or carry illegal drugs penalties can be severe

Business Culture: Information for Business Travelers

Business customs are similar to those in Europe and the United States. For men, normal business wear is suit and tie. During the cooler months -- June through September -- light woollens are recommended. Lunches and cocktail receptions are common business functions. Prospective visitors should bring an adequate supply of business cards as well as brochures and other literature.

Diseases/Health Data

Please Note: Most of the entry below constitutes a generalized health advisory, which a traveler might find useful, regardless of a particular destination.

As a supplement, however, the reader will also find below a list of countries flagged with current health notices and alerts issued by the Centers for Disease Control and Prevention (CDC). Please note that travel to the following countries, based on these 3 levels of warnings, is ill-advised, or should be undertaken with the utmost precaution:

Level 3 (highest level of concern; avoid non-essential travel) --

**Guinea - Ebola
Liberia - Ebola
Nepal - Earthquake zone
Sierra Leone - Ebola**

Level 2 (intermediate level of concern; use utmost caution during travel) --

**Cameroon - Polio
Somalia - Polio
Vanuatu - Tropical Cyclone zone
Throughout Middle East and Arabia Peninsula - MERS ((Middle East Respiratory Syndrome)**

Level 1 (standard level of concern; use practical caution during travel) -

**Australia - Ross River disease
Bosnia-Herzegovina - Measles
Brazil - Dengue Fever
Brazil - Malaria
Brazil - Zika
China - H7N9 Avian flu
Cuba - Cholera
Egypt - H5N1 Bird flu
Ethiopia - Measles
Germany - Measles
Japan - Hand, foot, and mouth disease (HFMD)
Kyrgyzstan - Measles
Malaysia -Dengue Fever**

Mexico - Chikungunya

Mexico - Hepatitis A

Nigeria - Meningitis

Philippines - Measles

Scotland - Mumps

Singapore - Hand, foot, and mouth disease (HFMD)

South Korea - MERS ((Middle East Respiratory Syndrome)

Throughout Caribbean - Chikungunya

Throughout Central America - Chikungunya

Throughout South America - Chikungunya

Throughout Pacific Islands - Chikungunya

For specific information related to these health notices and alerts please see the CDC's listing available at URL:

<http://wwwnc.cdc.gov/travel/notices>

Health Information for Travelers to Mauritius

Several cases of African trypanosomiasis (African sleeping sickness) have been reported from this region recently, including cases among tourists visiting game parks. For more information and recommendations on trypanosomiasis, see Travelers' Health Information on African Trypanosomiasis (<http://www.cdc.gov/travel/diseases/aftrypano.htm>).

Also, please check the Outbreaks section for important updates on this region, including information on the Epidemic of Meningococcal Disease in Addis Ababa, Ethiopia (<http://www.cdc.gov/travel/outbreaks.htm>).

Food and waterborne diseases are the number one cause of illness in travelers. Travelers' diarrhea can be caused by viruses, bacteria, or parasites, which are found throughout the region and can contaminate food or water. Infections may cause diarrhea and vomiting (*E. coli*, *Salmonella*, cholera, and parasites), fever (typhoid fever and toxoplasmosis), or liver damage (hepatitis). Make sure your food and drinking water are safe. (See below.)

Malaria is a preventable infection that can be fatal if left untreated. Prevent infection by taking prescription antimalarial drugs and protecting yourself against mosquito bites (see below). Most travelers to malaria risk areas in this region should take mefloquine to prevent malaria. You can be infected with malaria in all areas of this region except the cities of Addis Ababa, Ismara, and Nairobi, the islands of Reunion and Seychelles, and in highland areas above 2,500 meters. For

more detailed information about the risk in specific locations, see Malaria in East Africa (<http://www.cdc.gov/travel/regionalmalaria/eafrica.htm>).

A certificate of yellow fever vaccine may be required for entry into certain of these countries. For detailed information, see Comprehensive Yellow Fever Vaccination Requirements (<http://www.cdc.gov/travel/yelfever.htm>).

Dengue, filariasis, leishmaniasis, onchocerciasis, trypanosomiasis (sleeping sickness), and Rift Valley fever are diseases carried by insects that also occur in this region. Protecting yourself against insect bites will help to prevent these diseases.

Schistosomiasis, a parasitic infection, is found in fresh water in the region, including Lake Malawi. Do not swim in fresh water (except in well-chlorinated swimming pools) in these countries. (For more information, please see the Swimming Precautions on the Making Travel Safe page at URL <http://www.cdc.gov/travel/safety.htm>.)

Because motor vehicle crashes are a leading cause of injury among travelers, walk and drive defensively. Avoid nighttime travel if possible and always use seat belts.

CDC Recommends the Following Vaccines (as Appropriate for Age):

See your doctor at least 4-6 weeks before your trip to allow time for shots to take effect.

- Hepatitis A or immune globulin (IG).
- Hepatitis B, if you might be exposed to blood (for example, health-care workers), have sexual contact with the local population, stay longer than 6 months, or be exposed through medical treatment.
- Meningococcal (meningitis) vaccine, if you plan to visit the western half of Ethiopia (see meningitis map at URL <http://www.cdc.gov/travel/meninmap.htm>) from December through June.
- Rabies, if you might be exposed to wild or domestic animals through your work or recreation.
- Typhoid, particularly if you are visiting developing countries in this region.
- Yellow fever, if you travel anywhere outside urban areas.
- As needed, booster doses for tetanus-diphtheria, measles, and a one-time dose of polio vaccine for adults. Hepatitis B vaccine is now recommended for all infants and for children ages 11-12 years who did not receive the series as infants.

To Stay Healthy, Do:

- Wash hands often with soap and water.
- Drink only bottled or boiled water, or carbonated (bubbly) drinks in cans or bottles. Avoid tap water, fountain drinks, and ice cubes. If this is not possible, make water safer by BOTH filtering through an "absolute 1-micron or less" filter AND adding iodine tablets to the filtered water. "Absolute 1-micron filter" are found in camping/outdoor supply stores.

- Eat only thoroughly cooked food or fruits and vegetables you have peeled yourself. Remember: boil it, cook it, peel it, or forget it.
- If you travel to an area where there is risk for malaria, take your malaria prevention medication before, during, and after travel, as directed. (See your doctor for a prescription.)
- Protect yourself from insects by remaining in well-screened areas, using repellents (applied sparingly at 4-hour intervals) and permethrin-impregnated mosquito nets, and wearing long-sleeved shirts and long pants from dusk through dawn.
- To prevent fungal and parasitic infections, keep feet clean and dry, and do not go barefoot.
- Always use latex condoms to reduce the risk of HIV and other sexually transmitted diseases.

To Avoid Getting Sick:

- Don't eat food purchased from street vendors.
- Don't drink beverages with ice.
- Don't eat dairy products unless you know they have been pasteurized.
- Don't share needles with anyone.
- Don't handle animals (especially monkeys, dogs, and cats), to avoid bites and serious diseases (including rabies and plague). (For more information, please see the Animal-Associated Hazards on the Making Travel Safe page.)
- Don't swim in fresh water, including Lake Malawi. Salt water is usually safer. (For more information, please see the Swimming Precautions on the Making Travel Safe page.)

What You Need To Bring with You:

- Long-sleeved shirt and long pants to wear while outside whenever possible, to prevent illnesses carried by insects (e.g., malaria, dengue, filariasis, leishmaniasis, and onchocerciasis).
- Insect repellent containing DEET (diethylmethylnolamide), in 30%-35% strength for adults and 6%-10% for children. Unless you are staying in air-conditioned or well-screened housing, purchase a bed net impregnated with the insecticide permethrin. (Bed nets can be purchased in camping or military supply stores.)
- Over-the-counter antidiarrheal medicine to take if you have diarrhea.
- Iodine tablets and water filters to purify water if bottled water is not available. See Do's above for more detailed information about water filters.
- Sunblock, sunglasses, hat.
- Prescription medications: make sure you have enough to last during your trip, as well as a copy of the prescription(s).

After You Return Home:

If you have visited an area where there is risk for malaria, continue taking your malaria medication weekly for 4 weeks after you leave the area.

If you become ill after your trip—even as long as a year after you return—tell your doctor where you have traveled.

For More Information:

Ask your doctor or check the CDC web sites for more information about how to protect yourself against diseases that occur in East Africa, such as:

For information about diseases-

Carried by Insects

Dengue, Malaria, Yellow Fever

Carried in Food or Water

Cholera, *Escherichia coli*, diarrhea, Hepatitis A, Schistosomiasis, Typhoid Fever

Person-to-Person Contact

Hepatitis B, HIV/AIDS

For more information about these and other diseases, please check the Diseases (<http://www.cdc.gov/travel/diseases.htm>) section and the Health Topics A-Z (<http://www.cdc.gov/health/diseases.htm>).

Note:

Mauritius is located in the East Africa health region.

Chapter 6

Environmental Overview

Environmental Issues

General Overview:

Economic development is the major contributing factor to Mauritius ' environmental problems. The growth of polluting industries, inadequate sewage and other waste disposal systems, as well as the increasing use of agro-chemicals also presents a range of environmental challenges. As well, the coastline has its own set of challenges that involve both the exploitation of resources, and the associated effects on the larger marine eco-system.

Current Issues:

- water pollution
- threats to soil fertility, as a result of the use of pesticides and fertilizers
- coastal pollution
- over fishing and the loss of marine eco-systems

Total Greenhouse Gas Emissions (Mtc):

1.1

Country Rank (GHG output):

146th

Natural Hazards:

- cyclones
- maritime hazards posed by surrounding reefs

Environmental Policy

Regulation and Jurisdiction:

The regulation and protection of the environment in Mauritius is under the jurisdiction of the following:

- Ministry of Local Government and Environment
- Ministry of Agriculture, Fisheries and Co-operatives
- Ministry of Health and Quality of Life
- Ministry of Urban and Rural Development.

Major Non-Governmental Organizations:

N/A

International Environmental Accords:

Party to:

- Biodiversity
- Climate Change
- Climate Change-Kyoto Protocol
- Desertification
- Endangered Species
- Environmental Modification
- Hazardous Wastes
- Law of the Sea
- Marine Life Conservation
- Nuclear Test Ban
- Ozone Layer Protection
- Ship Pollution
- Wetlands

Signed but not ratified:

- None

Kyoto Protocol Status (year ratified):

2001

Global Environmental Snapshot

Introduction

The countries of the world face many environmental challenges in common. Nevertheless, the nature and intensity of problem vary from region to region, as do various countries' respective capacities, in terms of affluence and infrastructure, to remediate threats to environmental quality.

Consciousness of perils affecting the global environment came to the fore in the last third or so of the 20th century has continued to intensify well into the new millennium. According to the United Nations Environment Programme, considerable environmental progress has been made at the level of institutional developments, international cooperation accords, and public participation. Approximately two-dozen international environmental protection accords with global implications have been promulgated since the late 1970s under auspices of the United Nations and other

international organizations, together with many additional regional agreements. Attempts to address and rectify environmental problems take the form of legal frameworks, economic instruments, environmentally sound technologies and cleaner production processes as well as conservation efforts. Environmental impact assessments have increasingly been applied across the globe.

Environmental degradation affects the quality, or aesthetics, of human life, but it also displays potential to undermine conditions necessary for the sustainability of human life. Attitudes toward the importance of environmental protection measures reflect ambivalence derived from this bifurcation. On one hand, steps such as cleaning up pollution, dedicating parkland, and suchlike, are seen as embellishments undertaken by wealthy societies already assured they can successfully perform those functions deemed, ostensibly, more essential-for instance, public health and education, employment and economic development. On the other hand, in poorer countries, activities causing environmental damage-for instance the land degradation effects of unregulated logging, slash-and-burn agriculture, overgrazing, and mining-can seem justified insofar as such activities provide incomes and livelihoods.

Rapid rates of resource depletion are associated with poverty and high population growth, themselves correlated, whereas consumption per capita is much higher in the most developed countries, despite these nations' recent progress in energy efficiency and conservation. It is impossible to sequester the global environmental challenge from related economic, social and political challenges.

First-tier industrialized countries have recently achieved measurable decreases in environmental pollution and the rate of resource depletion, a success not matched in middle income and developing countries. It is believed that the discrepancy is due to the fact that industrialized countries have more developed infrastructures to accommodate changes in environmental policy, to apply environmental technologies, and to invest in public education. The advanced industrialized countries incur relatively lower costs in alleviating environmental problems, in comparison to developing countries, since in the former even extensive environmental programs represent a rather minuscule percentage of total expenditures. Conversely, budget constraints, lagged provision of basic services to the population, and other factors such as debt service and militarization may preclude institution of minimal environmental protection measures in the poorest countries.

A synopsis for the current situation facing each region of the world follows:

Regional Synopsis: Africa

The African continent, the world's second-largest landmass, encompasses many of the world's least developed countries. By global standards, urbanization is comparatively low but rising at a rapid rate. More heavily industrialized areas at the northern and southern ends of the continent

experience the major share of industrial pollution. In other regions the most serious environmental problems typically stem from inefficient subsistence farming methods and other forms of land degradation, which have affected an increasingly extensive area under pressure of a widely impoverished, fast-growing population. Africa's distribution of natural resources is very uneven. It is the continent at greatest risk of desertification, especially in the Sahel region at the edge of the Sahara but also in other dry-range areas. Yet at the same time, Africa also harbors some of the earth's richest and most diverse biological zones.

Key Points:

Up to half a billion hectares of African land are moderately to severely degraded, an occurrence reflecting short-fallow shifting cultivation and overgrazing as well as a climatic pattern of recurrent droughts.

Soil degradation is severe along the expanse directly south of the Sahara, from the west to the east coasts. Parts of southern Africa, central-eastern Africa, and the neighboring island of Madagascar suffer from serious soil degradation as well.

Africa contains about 17 percent of the world's forest cover, concentrated in the tropical belt of the continent. Many of the forests, however, are severely depleted, with an estimated 70 percent showing some degree of degradation.

Population growth has resulted in continuing loss of arable land, as inefficient subsistence farming techniques affect increasingly extensive areas. Efforts to implement settled, sustainable agriculture have met with some recent success, but much further progress in this direction is needed. Especially in previously uninhabited forestlands, concern over deforestation is intensifying.

By contrast, the African savanna remains the richest grassland in the world, supporting a substantial concentration of animal and plant life. Wildlife parks are sub-Saharan Africa's greatest tourist attraction, and with proper management-giving local people a stake in conservation and controlling the pace of development-could greatly enhance African economies.

Significant numbers of mammal species in parts of northern, southern and eastern Africa are currently threatened, while the biological diversity in Mauritania and Madagascar is even further compromised with over 20 percent of the mammal species in these two countries currently under threat.

With marine catch trends increasing from 500,000 metric tons in the 1950s to over 3,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Water resource vulnerability is a major concern in northeastern Africa, and a moderate concern across the rest of the continent. An exception is central Africa, which has plentiful water supplies.

Many Africans lack adequate access to resources, not just (if at all) because the resources are unevenly distributed geographically, but also through institutional failures such as faulty land tenure systems or political upheaval. The quality of Africa's natural resources, despite their spotty distribution, is in fact extraordinarily rich. The infrastructure needed to protect and benefit from this natural legacy, however, is largely lacking.

Regional Synopsis: Asia and the Pacific

Asia-earth's largest landmass-and the many large and nearly innumerable small islands lying off its Pacific shore display extraordinarily contrasting landscapes, levels of development, and degrees of environmental stress. In the classification used here, the world's smallest continent, Australia, is also included in the Asia-Pacific region.

The Asia-Pacific region is home to 9 of the world's 14 largest urban areas, and as energy use for utilities, industry and transport increases in developing economies, urban centers are subject to worsening air quality. Intense population density in places such as Bangladesh or Hong Kong is the quintessential image many people have of Asia, yet vast desert areas such as the Gobi and the world's highest mountain range, the Himalayas, span the continent as well. Forested areas in Southeast Asia and the islands of Indonesia and the Philippines were historically prized for their tropical hardwood, but in many places this resource is now severely depleted. Low-lying small island states are extremely vulnerable to the effects of global warming, both rising sea levels and an anticipated increase in cyclones.

Key Points:

Asian timber reserves are forecast to be depleted in the next 40 years. Loss of natural forest is irreversible in some areas, but plantation programs to restore tree cover may ameliorate a portion of the resulting land degradation.

Increased usage of fossil fuels in China and other parts of southern Asia is projected to result in a marked increase in emissions, especially in regard to carbon dioxide. The increased usage of energy has led to a marked upsurge in air pollution across the region.

Acidification is an emerging problem regionally, with sulfur dioxide emissions expected to triple by 2010 if the current growth rate is sustained. China, Thailand, India, and Korea seem to be suffering from particularly high rates of acid deposition. By contrast, Asia's most highly developed economy, Japan, has effected substantial improvements in its environmental indicators.

Water pollution in the Pacific is an urgent concern since up to 70 percent of the water discharged into the region's waters receives no treatment. Additionally, the disposal of solid wastes, in like manner, poses a major threat in a region with many areas of high population density.

The Asia-Pacific region is the largest expanse of the world's land that is adversely affected by soil degradation.

The region around Australia reportedly suffers the largest degree of ozone depletion.

The microstates of the Pacific suffer land loss due to global warming, and the consequent rise in the levels of ocean waters. A high-emissions scenario and anthropogenic climate impact at the upper end of the currently predicted range would probably force complete evacuation of the lowest-elevation islands sometime in this century.

The species-rich reefs surrounding Southeast Asia are highly vulnerable to the deleterious effects of coastal development, land-based pollution, over-fishing and exploitative fishing methods, as well as marine pollution from oil spills and other activities.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of China and south-east Asia are currently threatened, while the biological diversity in India, Japan, Australia, the Philippines, Indonesia and parts of Malaysia is even further compromised with over 20 percent of the mammal species in these countries currently under threat.

Water resource vulnerability is a serious concern in areas surrounding the Indian subcontinent.

Regional Synopsis: Central Asia

The Central Asian republics, formerly in the Soviet Union, experience a range of environmental problems as the result of poorly executed agricultural, industrial, and nuclear programs during the Soviet era. Relatively low population densities are the norm, especially since upon the breakup of the U.S.S.R. many ethnic Russians migrated back to European Russia. In this largely semi-arid region, drought, water shortages, and soil salinization pose major challenges.

Key Points:

The use of agricultural pesticides, such as DDT and other chemicals, has contributed to the contamination of soil and groundwater throughout the region.

Land and soil degradation, and in particular, increased salinization, is mostly attributable to faulty irrigation practices.

Significant desertification is also a problem in the region.

Air pollution is prevalent, mostly due to use of low octane automobile fuel.

Industrial pollution of the Caspian Sea and the Aral Sea, as a result of industrial effluents as well as mining and metal production, presents a challenge to the countries bordering these bodies of water.

One of the most severe environmental problems in the region is attributable to the several billion tons of hazardous materials stored in landfills across Central Asia.

Uzbekistan's particular problem involves the contraction of the Aral Sea, which has decreased in size by a third, as a consequence of river diversions and poor irrigation practices. The effect has been the near-total biological destruction of that body of water.

Kazakhstan, as a consequence of being the heartland of the former Soviet Union's nuclear program, has incurred a high of cancerous malignancies, biogenetic abnormalities and radioactive contamination.

While part of the Soviet Union, the republics in the region experienced very high levels of greenhouse gas emissions, as a consequence of rapid industrialization using cheap but dirty energy sources, especially coal.

By contrast, however, there have recently been substantial reductions in the level of greenhouse gas emissions, especially those attributable to coal burning, with further decreases anticipated over the next decade. These changes are partially due to the use of cleaner energy technologies, such as natural gas, augmented by governmental commitment to improving environmental standards.

Regional Synopsis: Europe

Western Europe underwent dramatic transformation of its landscape, virtually eliminating large-scale natural areas, during an era of rapid industrialization, which intensified upon its recovery from World War II. In Eastern Europe and European Russia, intensive land development has been less prevalent, so that some native forests and other natural areas remain. Air and water pollution from use of dirty fuels and industrial effluents, however, are more serious environmental problems in

Eastern than in Western Europe, though recent trends show improvement in many indicators. Acid rain has inflicted heavy environmental damage across much of Europe, particularly on forests. Europe and North America are the only regions in which water usage for industry exceeds that for agriculture, although in Mediterranean nations agriculture is the largest water consumer.

Key Points:

Europe contributes 36 percent of the world's chlorofluorocarbon emissions, 30 percent of carbon dioxide emissions, and 25 percent of sulfur dioxide emissions.

Sulfur and nitrogen oxide emissions are the cause of 30 to 50 percent of Central and Eastern Europe's deforestation.

Acid rain has been an environmental concern for decades and continues to be a challenge in parts of Western Europe.

Overexploitation of up to 60 percent of Europe's groundwater presents a problem in industrial and urban areas.

With marine catch trends increasing from 5,000,000 metric tons in the 1950s to over 20,000,000 metric tons by 2000, there was increasing concern about the reduction in fisheries and marine life, should this trend continue unabated.

Significant numbers of mammal species in parts of western Europe, Eastern Europe and Russia are currently threatened, while the biological diversity on the Iberian Peninsula is even further compromised with over 40 percent of the mammal species in this region currently under threat. As a result, there has been a 10 percent increase in protected areas of Europe.

A major environmental issue for Europe involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Some estimates suggest that up to 50 percent of the continent's fish species may be considered endangered species. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species.

Fortunately, in the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Recently, most European countries have adopted cleaner production technologies, and alternative methods of waste disposal, including recycling.

The countries of Eastern Europe have made air quality a major environmental priority. This is

exemplified by the Russian Federation's addition to the 1995 "Berlin Mandate" (transnational legislation based on resolutions of the Rio Earth Summit) compelling nations to promote "carbon sinks" to absorb greenhouse gases.

On a relative basis, when compared with the degree of industrial emissions emitted by many Eastern European countries until the late 1980s, there has been some marked increase in air quality in the region, as obsolete plants are closed and a transition to cleaner fuels and more efficient energy use takes place.

Regional Synopsis: The Middle and Near East

Quite possibly, the Middle East will exemplify the adage that, as the 20th century was a century fixated on oil, the 21st century will be devoted to critical decisions about water. Many (though far from all) nations in the Middle East rank among those countries with the largest oil and gas reserves, but water resources are relatively scarce throughout this predominantly dry region. Effects of global warming may cause moderately high elevation areas that now typically receive winter "snowpack" to experience mainly rain instead, which would further constrain dry-season water availability. The antiquities and religious shrines of the region render it a great magnet for tourism, which entails considerable economic growth potential but also intensifies stresses on the environment.

Key Points:

Water resource vulnerability is a serious concern across the entire region. The increased usage of, and further demand for water, has exacerbated long-standing water scarcity in the region. For instance, river diversions and industrial salt works have caused the Dead Sea to shrink by one-third from its original surface area, with further declines expected.

The oil industry in the region contributes to water pollution in the Persian Gulf, as a result of oil spills, which have averaged 1.2 million barrels of oil spilt per year (some sources suggest that this figure is understated). The consequences are severe because even after oil spills have been cleaned up, environmental damage to the food webs and ecosystems of marine life will persist for a prolonged period.

The region's coastal zone is considered one of the most fragile and endangered ecosystems of the world. Land reclamation, shoreline construction, discharge of industrial effluents, and tourism (such as diving in the Red Sea) contribute to widespread coastal damage.

Significant numbers of mammal species in parts of the Middle East are currently threatened.

Since the 1980s, 11 percent of the region's natural forest has been depleted.

Regional Synopsis: Latin America and the Caribbean

The Latin American and Caribbean region is characterized by exceedingly diverse landforms that have generally seen high rates of population growth and economic development in recent decades. The percentage of inhabitants residing in urban areas is quite high at 73.4 percent; the region includes the megacities of Mexico City, Sao Paulo, and Rio de Janeiro. The region also includes the world's second-highest mountain range, the Andes; significant expanses of desert and grassland; the coral reefs of the Caribbean Sea; and the world's largest contiguous tropical forest in the Amazon basin. Threats to the latter from subsistence and commercial farming, mineral exploitation and timbering are well publicized. Nevertheless, of eight countries worldwide that still retain at least 70 percent of their original forest cover, six are in Latin America. The region accounts for nearly half (48.3 percent) of the world's greenhouse gas emissions derived from land clearing, but as yet a comparatively minuscule share (4.3 percent) of such gases from industrial sources.

Key Points:

Although Latin America is one of the most biologically diverse regions of the world, this biodiversity is highly threatened, as exemplified by the projected extinction of up to 100,000 species in the next few decades. Much of this loss will be concentrated in the Amazon area, although the western coastline of South America will also suffer significant depletion of biological diversity. The inventory of rainforest species with potentially useful commercial or medical applications is incomplete, but presumed to include significant numbers of such species that may become extinct before they are discovered and identified.

Up to 50 percent of the region's grazing land has lost its soil fertility as a result of soil erosion, salinization, alkalinization and overgrazing.

The Caribbean Sea, the Atlantic Ocean, and the Pacific Ocean have all been contaminated by agricultural wastes, which are discharged into streams that flow into these major waters. Water pollution derived from phosphorous, nitrates and pesticides adversely affects fish stocks, contributes to oxygen depletion and fosters overgrowth of aquatic vegetation. Marine life will continue to be severely compromised as a result of these conditions.

Due to industrial development in the region, many beaches of eastern Latin America and the Caribbean suffer from tar deposits.

Most cities in the region lack adequate sewage treatment facilities, and rapid migration of the rural

poor into the cities is widening the gap between current infrastructure capacity and the much greater level needed to provide satisfactory basic services.

The rainforest region of the Amazon Basin suffers from dangerously high levels of deforestation, which may be a significant contributory factor to global warming or "the greenhouse effect." In the late 1990s and into the new millennium, the rate of deforestation was around 20 million acres of rainforest being destroyed annually.

Deforestation on the steep rainforest slopes of Caribbean islands contributes to soil erosion and landslides, both of which then result in heavy sedimentation of nearby river systems. When these sedimented rivers drain into the sea and coral reefs, they poison the coral tissues, which are vital to the maintenance of the reef ecosystem. The result is marine degradation and nutrient depletion. Jamaica's coral reefs have never quite recovered from the effects of marine degradation.

The Southern Cone of Latin America (Argentina, Brazil, Chile, Paraguay, and Uruguay) suffers the effects of greatly increased ultraviolet-B radiation, as a consequence of more intense ozone depletion in the southern hemisphere.

Water resource vulnerability is an increasingly major concern in the northwestern portion of South America.

Regional Synopsis: North America

North American nations, in particular the United States and Canada, rank among the world's most highly developed industrial economies—a fact which has generated significant pollution problems, but also financial resources and skills that have enabled many problems to be corrected. Although efforts to promote energy efficiency, recycling, and suchlike have helped ease strains on the environment in a part of the world where per capita consumption levels are high, sprawling land development patterns and recent preferences many households have demonstrated for larger vehicles have offset these advances.

Meanwhile, a large portion of North America's original forest cover has been lost, though in many cases replaced by productive second-growth woodland. In recent years, attitudes toward best use of the region's remaining natural or scenic areas seem to be shifting toward recreation and preservation and away from resource extraction. With increasing attention on the energy scarcity in the United States, however, there is speculation that this shift may be short-lived. Indeed, the energy shortage on the west coast of the United States and associated calls for energy exploration, indicate a possible retrenchment toward resource extraction. At the same time, however, it has also served to highlight the need for energy conservation as well as alternative energy sources.

Despite generally successful anti-pollution efforts, various parts of the region continue to suffer significant air, water and land degradation from industrial, vehicular, and agricultural emissions and runoff. Mexico, as a middle-income country, displays environmental problems characteristic of a developing economy, including forest depletion, pollution from inefficient industrial processes and dirty fuels, and lack of sufficient waste-treatment infrastructure.

Key Points:

Because of significantly greater motor vehicle usage in the United States (U.S.) than in the rest of the world, the U.S. contribution of urban air pollution and greenhouse gas emissions, especially carbon dioxide, is disproportionately high in relation to its population.

Acid rain is an enduring issue of contention in the northeastern part of the United States, on the border with Canada.

Mexico's urban areas suffer extreme air pollution from carbon monoxide, nitrogen oxides, sulfur dioxide, and other toxic air pollutants. Emissions controls on vehicles are in their infancy, compared to analogous regulations in the U.S.

The cities of Mexico, including those on the U.S. border, also discharge large quantities of untreated or poorly treated sewage, though officials are currently planning infrastructure upgrades.

Deforestation is noteworthy in various regions of the U.S., especially along the northwest coastline. Old growth forests have been largely removed, but in the northeastern and upper midwestern sections of the United States, evidence suggests that the current extent of tree cover probably surpasses the figure for the beginning of the 20th century.

Extreme weather conditions in the last few years have resulted in a high level of soil erosion along the north coast of California; in addition, the coastline itself has shifted substantially due to soil erosion and concomitant landslides.

Agricultural pollution-including nitrate contamination of well water, nutrient runoff to waterways, and pesticide exposure-is significant in various areas. Noteworthy among affected places are California's Central Valley, extensive stretches of the Midwest, and land in the Chesapeake Bay watershed.

Inland waterways, especially around the Great Lakes, have substantially improved their water quality, due to concentrated efforts at reducing water pollution by governmental, commercial and community representatives. Strict curbs on industrial effluents and near-universal implementation of sewage treatment are the chief factors responsible for this improvement.

A major environmental issue for Canada and the United States involves the depletion of various already endangered or threatened species, and most significantly, the decline of fish stocks. Coastal fisheries have been over-harvested, resulting in catch limits or moratoriums on many commercially important fish species. In the last few years, these policies have started to yield measurable results with decreasing trends in marine fish catch.

Due to the decay of neighboring ecosystems in Central America and the Caribbean, the sea surrounding Florida has become increasingly sedimented, contributing to marine degradation, nutrient depletion of the ecosystem, depletion of fish stocks, and diseases to coral species in particular.

Polar Regions

Key Points:

The significant rise in sea level, amounting 10 to 25 centimeters in the last 100 years, is due to the melting of the Arctic ice sheets, and is attributed to global warming.

The Antarctic suffers from a significant ozone hole, first detected in 1976. By 1985, a British scientific team reported a 40 percent decrease in usual regeneration rates of the ozone. Because a sustained increase in the amount of ultraviolet-B radiation would have adverse consequences upon all planetary life, recent environmental measures have been put into effect, aimed at reversing ozone depletion. These measures are projected to garner significant results by 2050.

Due to air and ocean currents, the Arctic is a sink for toxic releases originally discharged thousands of miles away. Arctic wildlife and Canada's Inuit population have higher bodily levels of contaminants such as PCB and dioxin than those found in people and animals in much of the rest of the world.

Global Environmental Concepts

-

1. Global Warming and Greenhouse Gases

The Greenhouse Effect:

In the early 19th century, the French physicist, Jean Fourier, contended that the earth's atmosphere functions in much the same way as the glass of a greenhouse, thus describing what is now understood as the "greenhouse effect." Put simply, the "greenhouse effect" confines some of the sun's energy to the earth, preserving some of the planet's warmth, rather than allowing it to flow back into space. In so doing, all kinds of life forms can flourish on earth. Thus, the "greenhouse effect" is necessary to sustain and preserve life forms and ecosystems on earth.

In the late 19th century, a Swedish chemist, Svante Arrhenius, noticed that human activities, such as the burning of coal and other fossil fuels for heat, and the removal of forested lands for urban development, led to higher concentrations of greenhouse gases, like carbon dioxide and methane, in the atmosphere. This increase in the levels of greenhouse gases was believed to advance the "greenhouse effect" exponentially, and might be related to the trend in global warming.

In the wake of the Industrial Revolution, after industrial development took place on a large scale and the total human population burgeoned simultaneously with industrialization, the resulting increase in greenhouse gas emissions could, many scientists believe, be significant enough to have some bearing on climate. Indeed, many studies in recent years support the idea that there is a linkage between human activities and global warming, although there is less consensus on the extent to which this linkage may be relevant to environmental concerns.

That said, some scientists have argued that temperature fluctuations have existed throughout the evolution of the planet. Indeed, Dr. S. Fred Singer, the president of the Science and Environment Policy Project has noted that 3,000-year-old geological records of ocean sediment reveal changes in the surface temperature of the ocean. Hence, it is possible that climate variability is merely a normal fact of the planet's evolution. Yet even skeptics as to anthropogenic factors concur that any substantial changes in global temperatures would likely have an effect upon the earth's ecosystems, as well as the life forms that inhabit them.

The Relationship Between Global Warming and Greenhouse Gases:

A large number of climatologists believe that the increase in atmospheric concentrations of "greenhouse gas emissions," mostly a consequence of human activities such as the burning of fossil fuels, are contributing to global warming. The cause notwithstanding, the planet has reportedly warmed 0.3°C to 0.6°C over the last century. Indeed, each year during the 1990s was one of the very warmest in the 20th century, with the mean surface temperature for 1999 being the fifth warmest on record since 1880.

In early 2000, a panel of atmospheric scientists for the National Research Council concluded in a report that global warming was, indeed, a reality. While the panel, headed by Chairman John Wallace, a professor of atmospheric sciences at the University of Washington, stated that it

remained unclear whether human activities have contributed to the earth's increasing temperatures, it was apparent that global warming exists.

In 2001, following a request for further study by the incoming Bush administration in the [United States](#), the National Academy of Sciences again confirmed that global warming had been in existence for the last 20 years. The study also projected an increase in temperature between 2.5 degrees and 10.4 degrees Fahrenheit by the year 2100. Furthermore, the study found the leading cause of global warming to be emissions of carbon dioxide from the burning of fossil fuels, and it noted that greenhouse gas accumulations in the earth's atmosphere was a result of human activities.

Within the scientific community, the controversy regarding has centered on the difference between surface air and upper air temperatures. Information collected since 1979 suggests that while the earth's surface temperature has increased by about a degree in the past century, the atmospheric temperature five miles above the earth's surface has indicated very little increase. Nevertheless, the panel stated that this discrepancy in temperature between surface and upper air does not invalidate the conclusion that global warming is taking place. Further, the panel noted that natural events, such as volcanic eruptions, can decrease the temperature in the upper atmosphere.

The major consequences of global warming potentially include the melting of the polar ice caps, which, in turn, contribute to the rise in sea levels. Many islands across the globe have already experienced a measurable loss of land as a result. Because global warming may increase the rate of evaporation, increased precipitation, in the form of stronger and more frequent storm systems, is another potential outcome. Other consequences of global warming may include the introduction and proliferation of new infectious diseases, loss of arable land (referred to as "desertification"), destructive changes to existing ecosystems, loss of biodiversity and the isolation of species, and concomitant adverse changes in the quality of human life.

International Policy Development in Regard to Global Warming:

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to

changes in climate.

2. To ensure and enable sustainable development and food production on a global scale.

*** See section on "International Environmental Agreements and Associations" for information related to international policies related to limiting greenhouse gases and controlling climate change emanating from historic summits at Kyoto, Copenhagen, Doha, and Paris. ***

2. Air Pollution

Long before global warming reared its head as a significant issue, those concerned about the environment and public health noted the deleterious effects of human-initiated combustion upon the atmosphere. Killer smogs from coal burning triggered acute health emergencies in London and other places. At a lower level of intensity motor vehicle, power plant, and industrial emissions impaired long-range visibility and probably had some chronic adverse consequences on the respiratory systems of persons breathing such air.

In time, scientists began associating the sulfur dioxide and nitrogen oxides released from coal burning with significant acid deposition in the atmosphere, eventually falling as "acid rain." This phenomenon has severely degraded forestlands, especially in Europe and a few parts of the [United States](#). It has also impaired some aquatic ecosystems and eaten away the surface of some human artifacts, such as marble monuments. Scrubber technology and conversion to cleaner fuels have enabled the level of industrial production to remain at least constant while significantly reducing acid deposition. Technologies aimed at cleaning the air and curtailing acid rain, soot, and smog may, nonetheless, boomerang as the perils of global warming become increasingly serious. In brief, these particulates act as sort of a sun shade -- comparable to the effect of volcanic eruptions on the upper atmosphere whereby periods of active volcanism correlate with temporarily cooler weather conditions. Thus, while the carbon dioxide releases that are an inevitable byproduct of combustion continue, by scrubbing the atmosphere of pollutants, an industrial society opens itself to greater insolation (penetration of the sun's rays and consequent heating), and consequently, it is likely to experience a correspondingly greater rise in ambient temperatures.

The health benefits of removing the sources of acid rain and smog are indisputable, and no one would recommend a return to previous conditions. Nevertheless, the problematic climatic effects of continually increasing emissions of carbon dioxide and other greenhouse gases pose a major global environmental challenge, not as yet addressed adequately.

3. Ozone Depletion

The stratospheric ozone layer functions to prevent ultraviolet radiation from reaching the earth. Normally, stratospheric ozone is systematically disintegrated and regenerated through natural photochemical processes. The stratospheric ozone layer, however, has been depleted unnaturally as a result of anthropogenic (man-made) chemicals, most especially chlorine and bromide compounds such as chlorofluorocarbons (CFCs), halons, and various industrial chemicals in the form of solvents, refrigerants, foaming agents, aerosol propellants, fire retardants, and fumigants. Ozone depletion is of concern because it permits a greater degree of ultraviolet-B radiation to reach the earth, which then increases the incidences of cancerous malignancies, cataracts, and human immune deficiencies. In addition, even in small doses, ozone depletion affects the ecosystem by disturbing food chains, agriculture, fisheries and other forms of biological diversity.

Transnational policies enacted to respond to the dangers of ozone depletion include the 1985 Vienna Convention on the Protection of the Ozone Layer and the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer. The Montreal Protocol was subsequently amended in London in 1990, Copenhagen in 1992 and Vienna in 1995. By 1996, 155 countries had ratified the Montreal Protocol, which sets out a time schedule for the reduction (and eventual elimination) of ozone depleting substances (OPS), and bans exports and imports of ODS from and to non-participant countries.

In general, the Protocol stipulates that developed countries must eliminate halon consumption by 1994 and CFC consumption by 1996, while developing countries must eliminate these substances by 2010. Consumption of methyl bromide, which is used as a fumigant, was to be frozen at the 1995 in developed countries, and fully eliminated in 2010, while developing countries are to freeze consumption by 2002, based on average 1995-1998 consumption levels. Methyl chloroform is to be phased out by 2005. Under the Montreal Protocol, most ODS will be completely eliminated from use by 2010.

4. Land Degradation

In recent decades, land degradation in more arid regions of the world has become a serious concern. The problem, manifest as both "desertification" and "devegetation," is caused primarily by climate variability and human activities, such as "deforestation," excessive cultivation, overgrazing, and other forms of land resource exploitation. It is also exacerbated by inadequate irrigation practices. Although the effects of droughts on drylands have been temporary in the past, today, the productivity and sustainability of these lands have been severely compromised for the long term. Indeed, in every region of the world, land degradation has become an acute issue.

Desertification and Devegetation:

"Desertification" is a process of land degradation causing the soil to deteriorate, thus losing its nutrients and fertility, and eventually resulting in the loss of vegetation, known as "devegetation." As aforementioned, "desertification" and "devegetation" are caused by human activities, yet human beings are also the greatest casualties. Because these forms of land degradation affect the ability of the soil to produce crops, they concomitantly contribute to poverty. As population increases and demographic concentrations shift, the extent of land subject to stresses by those seeking to wrest subsistence from it has inexorably risen.

In response, the United Nations has formed the Convention to Combat Desertification-aimed at implementing programs to address the underlying causes of desertification, as well as measures to prevent and minimize its effects. Of particular significance is the formulation of policies on transboundary resources, such as areas around lakes and rivers. At a broader level, the Convention has established a Conference of Parties (COP), which includes all ratifying governments, for directing and advancing international action.

To ensure more efficacious use of funding, the Convention intends to reconfigure international aid to utilize a consultative and coordinated approach in the disbursement and expenditure of donor funds. In this way, local communities that are affected by desertification will be active participants in the solution-generation process. In-depth community education projects are envisioned as part of this new international aid program, and private donor financing is encouraged. Meanwhile, as new technologies are developed to deal with the problem of desertification, they need to be distributed for application across the world. Hence, the Convention calls for international cooperation in scientific research in this regard.

Desertification is a problem of sustainable development. It is directly connected to human challenges such as poverty, social and economic well-being and environmental protection as well. Broader environmental issues, such as climate change, biological diversity, and freshwater supplies, are indirectly related, so any effort to resolve this environmental challenge must entail coordinated research efforts and joint action.

Deforestation:

Deforestation is not a recent phenomenon. For centuries, human beings have cut down trees to clear space for land cultivation, or in order to use the wood for fuel. Over the last 200 years, and most especially after World War II, deforestation increased because the logging industry became a globally profitable endeavor, and so the clearing of forested areas was accelerated for the purposes of industrial development. In the long term, this intensified level of deforestation is considered problematic because the forest is unable to regenerate itself quickly. The deforestation that has

occurred in tropical rainforests is seen as an especially serious concern, due to the perceived adverse effects of this process upon the entire global ecosystem.

The most immediate consequence of deforestation is soil degradation. Soil, which is necessary for the growth of vegetation, can be a fragile and vital property. Organically, an extensive evolution process must take place before soil can produce vegetation, yet at the same time, the effects of natural elements, such as wind and rain, can easily and quickly degrade this resource. This phenomenon is known as soil erosion. In addition, natural elements like wind and rain reduce the amount of fertile soil on the ground, making soil scarcity a genuine problem. When fertile topsoil that already exists is removed from the landscape in the process of deforestation, soil scarcity is further exacerbated. Equally significant is the fact that once land has been cleared so that the topsoil can be cultivated for crop production, not only are the nutrient reserves in the soil depleted, thus producing crops of inferior quality, but the soil structure itself becomes stressed and deteriorates further.

Another direct result of deforestation is flooding. When forests are cleared, removing the cover of vegetation, and rainfall occurs, the flow of water increases across the surface of land. When extensive water runoff takes place, the frequency and intensity of flooding increases. Other adverse effects of deforestation include the loss of wildlife and biodiversity within the ecosystem that supports such life forms.

At a broader level, tropical rainforests play a vital role in maintaining the global environmental system. Specifically, destruction of tropical rainforests affects the carbon dioxide cycle. When forests are destroyed by burning (or rotting), carbon dioxide is released into the air, thus contributing to an intensified "greenhouse effect." The increase in greenhouse gas emissions like carbon dioxide is a major contributor to global warming, according to many environmental scientists. Indeed, trees themselves absorb carbon dioxide in the process of photosynthesis, so their loss also reduces the absorption of greenhouse gases.

Tropical rainforest destruction also adversely affects the nitrogen cycle. Nitrogen is a key nutrient for both plants and animals. Plants derive nitrogen from soil, while animals obtain it via nitrogen-enriched vegetation. This element is essential for the formation of amino acids, and thereby for proteins and biochemicals that all living things need for metabolism and growth. In the nitrogen cycle, vegetation acquires these essential proteins and biochemicals, and then cyclically returns them to the atmosphere and global ecosystem. Accordingly, when tropical rainforest ecosystems are compromised, not only is vegetation removed; the atmosphere is also affected and climates are altered. At a more immediate level, the biodiversity within tropical rainforests, including wildlife and insect species and a wealth of plant varieties, is depleted. Loss of rare plants is of particular concern because certain species as yet unknown and unused could likely yield many practical benefits, for instance as medicines.

As a result of the many challenges associated with deforestation, many environmental groups and agencies have argued for government policies on the sustainable development of forests by governments across the globe. While many countries have instituted national policies and programs aimed at reducing deforestation, and substantial research has been advanced in regard to sustainable and regenerative forestry development, there has been very little progress on an international level. Generally speaking, most tropical rainforests are located in developing and less developed countries, where economic growth is often dependent upon the exploitation of tropical rainforests. Timber resources as well as wildlife hunting tend to be particularly lucrative arenas.

In places such as the Amazon, where deforestation takes place for the construction of energy plants aimed at industrialization and economic development, there is an exacerbated effect on the environment. After forests are cleared in order to construct such projects, massive flooding usually ensues. The remaining trees then rot and decay in the wake of the flooding. As the trees deteriorate, their biochemical makeup becomes more acidic, producing poisonous substances such as hydrogen sulphide and methane gases. Acidified water subsequently corrodes the mechanical equipment and operations of the plants, which are already clogged by rotting wood after the floodwaters rise.

Deforestation generally arises from an economically plausible short-term motivation, but nonetheless poses a serious global concern because the effects go beyond national boundaries. The United Nations has established the World Commission on Forest and Sustainable Development. This body's task is to determine the optimal means of dealing with the issue of deforestation, without unduly affecting normal economic development, while emphasizing the global significance of protecting tropical forest ecosystems.

5. Water Resources

For all terrestrial fauna, including humans, water is the most immediate necessity to sustain life. As the population has increased and altered an ever-greater portion of the landscape from its natural condition, demand on water resources has intensified, especially with the development of industrialization and large-scale irrigation. The supply of freshwater is inherently limited, and moreover distributed unevenly across the earth's landmasses. Moreover, not just demand for freshwater but activities certain to degrade it are becoming more pervasive. By contrast, the oceans form a sort of "last wilderness," still little explored and in large part not seriously affected by human activity. However, coastal environments - the biologically richest part of the marine ecosystem-are experiencing major depletion due to human encroachment and over-exploitation.

Freshwater:

In various regions, for instance the Colorado River in the western [United States](#), current withdrawals of river water for irrigation, domestic, and industrial use consume the entire streamflow so that almost no water flows into the sea at the river's mouth. Yet development is ongoing in many such places, implying continually rising demand for water. In some areas reliant on groundwater, aquifers are being depleted at a markedly faster rate than they are being replenished. An example is the San Joaquin Valley in California, where decades of high water withdrawals for agriculture have caused land subsidence of ten meters or more in some spots. Naturally, the uncertainty of future water supplies is particularly acute in arid and semi-arid regions. Speculation that the phenomenon of global warming will alter geographic and seasonal rainfall patterns adds further uncertainty.

Water conservation measures have great potential to alleviate supply shortages. Some city water systems are so old and beset with leaking pipes that they lose as much water as they meter. Broad-scale irrigation could be replaced by drip-type irrigation, actually enhancing the sustainability of agriculture. In many areas where heavy irrigation has been used for decades, the result is deposition of salts and other chemicals in the soil such that the land becomes unproductive for farming and must be abandoned.

Farming is a major source of water pollution. Whereas restrictions on industrial effluents and other "point sources" are relatively easy to implement, comparable measures to reform hydraulic practices at farms and other "nonpoint sources" pose a significantly knottier challenge. Farm-caused water pollution takes the following main forms:

- Nitrate pollution found in wells in intensive farming areas as a consequence of heavy fertilizer use is a threat to human health. The most serious danger is to infants, who by ingesting high-nitrate water can contract methemoglobinemia, sometimes called "blue baby syndrome," a potentially fatal condition.
- Fertilizer runoff into rivers and lakes imparts unwanted nutrients that cause algae growth and eventual loss of oxygen in the body of water, degrading its ability to support fish and other desirable aquatic life.
- Toxic agricultural chemicals - insecticides, herbicides, and fungicides - are detectable in some aquifers and waterways.

In general, it is much easier to get a pollutant into water than to retrieve it out. Gasoline additives, dry cleaning chemicals, other industrial toxins, and in a few areas radionuclides have all been found in water sources intended for human use. The complexity and long time scale of subterranean hydrological movements essentially assures that pollutants already deposited in aquifers will continue to turn up for decades to come. Sophisticated water treatment processes are available, albeit expensive, to reclaim degraded water and render it fit for human consumption. Yet

source protection is unquestionably a more desirable alternative.

In much of the developing world, and even some low-income rural enclaves of the developed world, the population lacks ready access to safe water. Surface water and shallow groundwater supplies are susceptible to contamination from untreated wastewater and failing septic tanks, as well as chemical hazards. The occurrence of waterborne disease is almost certainly greatly underreported.

Marine Resources:

Coastal areas have always been desirable places for human habitation, and population pressure on them continues to increase. Many types of water degradation that affect lakes and rivers also affect coastal zones: industrial effluents, untreated or partially treated sewage, nutrient load from agriculture figure prominently in both cases. Prospects for more extreme storms as a result of global warming, as well as the pervasiveness of poorly planned development in many coastal areas, forebode that catastrophic hurricanes and landslides may increase in frequency in the future. Ongoing rise in sea levels will force remedial measures and in some cases abandonment of currently valuable coastal property.

Fisheries over much of the globe have been overharvested, and immediate conservation measures are required to preserve stocks of many species. Many governments subsidized factory-scale fishing fleets in the 1970s and 1980s, and the resultant catch increase evidently surpassed a sustainable level. It is uncertain how much of the current decline in fish stocks stems from overharvesting and how much from environmental pollution. The deep ocean remains relatively unaffected by human activity, but continental shelves near coastlines are frequently seriously polluted, and these close-to-shore areas are the major biological nurseries for food fish and the smaller organisms they feed on.

6. Environmental Toxins

Toxic chemical pollution exploded on the public consciousness with disclosure of spectacularly polluted industrial areas such as Love Canal near Buffalo, New York. There is no question that pollutants such as organophosphates or radionucleides can be highly deleterious to health, but evidence to date suggests that seriously affected areas are a localized rather than universal problem.

While some explore the possibilities for a lifestyle that fully eschews use of modern industrial chemicals, the most prevalent remediative approach is to focus on more judicious use. The most efficient chemical plants are now able to contain nearly all toxic byproducts of their production processes within the premises, minimizing the release of such substances into the environment.

Techniques such as Integrated Pest Management (IPM) dictate limited rather than broadcast use of pesticides: application only when needed using the safest available chemical, supplemented as much as possible with nontoxic controls.

While heightened public awareness and growing technical sophistication suggest a hopeful outlook on limiting the damage from manmade environmental toxins, one must grant that previous incidents of their misuse and mishandling have already caused environmental damage that will have to be dealt with for many years to come. In the case of the most hazardous radioactive substances, the time scale for successful remediation actually extends beyond that of the recorded history of civilization. Moreover, in this era of high population density and rapid economic growth, quotidian activities such as the transport of chemicals will occasionally, seemingly inevitably result in accidents with adverse environmental consequences.

7. "Islandization" and Biodiversity

With increased awareness regarding the adverse effects of unregulated hunting and habitat depletion upon wildlife species and other aspects of biodiversity, large-scale efforts across the globe have been initiated to reduce and even reverse this trend.

In every region of the world, many species of wildlife and areas of biodiversity have been saved from extinction. Nationally, many countries have adopted policies aimed at preservation and conservation of species, and one of the most tangible measures has been the proliferation of protected habitats. Such habitats exist in the form of wildlife reserves, marine life reserves, and other such areas where biodiversity can be protected from external encroachment and exploitation.

Despite these advances in wildlife and biodiversity protection, further and perhaps more intractable challenges linger. Designated reserves, while intended to prevent further species decline, exist as closed territories, fragmented from other such enclaves and disconnected from the larger ecosystem. This environmental scenario is referred to as "islandization." Habitat reserves often serve as oversized zoos or game farms, with landscapes and wildlife that have effectively been "tamed" to suit. Meanwhile, the larger surrounding ecosystem continues to be seriously degraded and transformed, while within the islandized habitat, species that are the focus of conservation efforts may not have sufficient range and may not be able to maintain healthy genetic variability.

As a consequence, many conservationists and preservationists have demanded that substantially larger portions of land be withheld as habitat reserves, and a network of biological corridors to connect continental reserves be established. While such efforts to combat islandization have considerable support in the [United States](#), how precisely such a program would be instituted, especially across national boundaries, remains a matter of debate. International conservationists and preservationists say without a network of reserves a massive loss of biodiversity will result.

The concept of islandization illustrates why conservation and preservation of wildlife and biodiversity must consider and adopt new, broader strategies. In the past, conservation and preservation efforts have been aimed at specific species, such as the spotted owl and grizzly bear in North America, the Bengal tiger in Southeast Asia, the panda in [China](#), elephants in Africa. Instead, the new approach is to simultaneously protect many and varied species that inhabit the same ecosystem. This method, referred to as "bio-regional conservation," may more efficaciously generate longer-term and more far-reaching results precisely because it is aimed at preserving entire ecosystems, and all the living things within.

More About Biodiversity Issues:

This section is directly taken from the United Nations Environmental Program: "[Biodiversity Assessment](#)"

The Global Biodiversity Assessment, completed by 1500 scientists under the auspices of United Nations Environmental Program in 1995, updated what is known (or unknown) about global biological diversity at the ecosystem, species and genetic levels. The assessment was uncertain of the total number of species on Earth within an order of magnitude. Of its working figure of 13 million species, only 13 percent are scientifically described. Ecological community diversity is also poorly known, as is its relationship to biological diversity, and genetic diversity has been studied for only a small number of species. The effects of human activities on biodiversity have increased so greatly that the rate of species extinctions is rising to hundreds or thousands of times the background level. These losses are driven by increasing demands on species and their habitats, and by the failure of current market systems to value biodiversity adequately. The Assessment calls for urgent action to reverse these trends.

There has been a new recognition of the importance of protecting marine and aquatic biodiversity. The first quantitative estimates of species losses due to growing coral reef destruction predict that almost 200,000 species, or one in five presently contributing to coral reef biodiversity, could die out in the next 40 years if human pressures on reefs continue to increase.

Since Rio, many countries have improved their understanding of the status and importance of their biodiversity, particularly through biodiversity country studies such as those prepared under the auspices of UNEP/GEF. The [United Kingdom](#) identified 1250 species needing monitoring, of which 400 require action plans to ensure their survival. Protective measures for biodiversity, such as legislation to protect species, can prove effective. In the USA, almost 40 percent of the plants and animals protected under the Endangered Species Act are now stable or improving as a direct result of recovery efforts. Some African countries have joined efforts to protect threatened species through the 1994 Lusaka Agreement, and more highly migratory species are being protected by

specialized cooperative agreements among range states under the Bonn Agreement.

There is an emerging realization that a major part of conservation of biological diversity must take place outside of protected areas and involve local communities. The extensive agricultural areas occupied by small farmers contain much biodiversity that is important for sustainable food production. Indigenous agricultural practices have been and continue to be important elements in the maintenance of biodiversity, but these are being displaced and lost. There is a new focus on the interrelationship between agrobiodiversity conservation and sustainable use and development practices in smallholder agriculture, with emphasis on use of farmers' knowledge and skills as a source of information for sustainable farming.

Perhaps even more important than the loss of biodiversity is the transformation of global biogeochemical cycles, the reduction in the total world biomass, and the decrease in the biological productivity of the planet. While quantitative measurements are not available, the eventual economic and social consequences may be so significant that the issue requires further attention.

International Environmental Agreements and Associations

International Policy Development in Regard to Global Warming:

Introduction

Regardless of what the precise nature of the relationship between greenhouse gas emissions and global warming may be, it seems that there is some degree of a connection between the phenomena. Any substantial reductions in greenhouse gas emissions and global warming trends will likely involve systematic changes in industrial operations, the use of advanced energy sources and technologies, as well as global cooperation in implementing and regulating these transformations.

In this regard, the United Nations Framework Convention on Climate Change (UNFCCC) stipulated the following objectives:

1. To stabilize "greenhouse gas" concentrations within the atmosphere, in such a manner that would preclude hazardous anthropogenic intervention into the existing biosphere and ecosystems of the world. This stabilization process would facilitate the natural adaptation of ecosystems to changes in climate.
2. To ensure and enable sustainable development and food production on a global scale.

Following are two discussions regarding international policies on the environment, followed by listings of international accords.

Special Entry: The Kyoto Protocol

The UNFCCC was adopted at the Rio Earth Summit in 1992, and entered into force in 1994. Over 175 parties were official participants.

Meanwhile, however, many of the larger, more industrialized nations failed to reach the emissions' reduction targets, and many UNFCCC members agreed that the voluntary approach to reducing emissions had not been successful. As such, UNFCCC members reached a consensus that legally binding limits were necessitated, and agreed to discuss such a legal paradigm at a meeting in Kyoto, [Japan](#) in 1997. At that meeting, the UNFCCC forged the Kyoto Protocol. This concord is the first legally binding international agreement that places limits on emissions from industrialized countries. The major greenhouse gas emissions addressed in the Kyoto Protocol include carbon dioxide, nitrous oxide, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and methane.

The provisions of the Kyoto Protocol stipulate that economically advanced nations must reduce their combined emissions of greenhouse gases, by approximately five percent from their 1990

levels, before the 2008-2010 deadline. Countries with the highest carbon dioxide emissions, such as the [United States](#) (U.S.), many of the European Union (EU) countries, and [Japan](#), are to reduce emissions by a scale of 6 to 8 percent. All economically advanced nations must show "demonstrable progress" by 2005. In contrast, no binding limits or timetable have been set on developing countries. Presumably, this distinction is due to the fact that most developing countries - - with the obvious exceptions of [India](#) and [China](#) -- simply do not emit as many greenhouse gases as do more industrially advanced countries. Meanwhile, these countries are entrenched in the process of economic development.

Regardless of the aforementioned reasoning, there has been strong opposition against the asymmetrical treatment assigned to emissions limits among developed and developing countries. Although this distinction might be regarded as unfair in principle, associations such as the Alliance of Small Island States have been vocal in expressing how global warming -- a result of greenhouse gas emissions - has contributed to the rise in sea level, and thus deleteriously affected their very existence as island nation states. For this reason, some parties have suggested that economically advanced nations, upon returning to their 1990 levels, should be required to further reduce their greenhouse gas emissions by a deadline of 2005. In response, interested parties have observed that even if such reductions were undertaken by economically advanced nations, they would not be enough to completely control global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming. Indeed, a reduction in the rate of fossil fuel usage by developing nations would also be necessary to have substantial ameliorative effect on global warming.

As such, the Protocol established a "Clean Development Mechanism" which permits developed countries to invest in projects aimed at reducing emissions within developing countries in return for credit for the reductions. Ostensibly, the objective of this mechanism is to curtail emissions in developing countries without unduly penalizing them for their economic development. Under this model, the countries with more potential emissions credits could sell them to other signatories of the Kyoto Protocol, whose emissions are forecast to significantly rise in the next few years. Should this trading of emissions credits take place, it is estimated that the Kyoto Protocol's emissions targets could still be met.

In 1999, the International Energy Outlook projected that Eastern Europe, the former Soviet Union and Newly Independent States, as well as parts of Asia, are all expected to show a marked decrease in their level of energy-related carbon emissions in 2010. Nations with the highest emissions, specifically, the U.S., the EU and [Japan](#), are anticipated to reduce their emissions by up to 8 percent by 2012. By 2000, however, the emissions targets were not on schedule for achievement. Indeed, the U.S. Department of Energy estimates forecast that by 2010, there will be a 34 percent increase in carbon emissions from the 1990 levels, in the absence of major shifts in policy, economic growth, energy prices, and consumer trends. Despite this assessment in the U.S., international support for the Kyoto Protocol remained strong, especially among European countries

and island states, who view the pact as one step in the direction away from reliance on fossil fuels and other sources of greenhouse gases.

In 2001, U.S. President, George W. Bush, rejected his country's participation in the Kyoto Protocol, saying that the costs imposed on the global economic system, and especially, on the US, overshadowed the benefits of the Protocol. He also cited the unfair burden on developed nations to reduce emissions, as another primary reasons for withdrawal from the international pact, as well as insufficient evidence regarding the science of global warming. Faced with impassioned international disapproval for his position, the U.S. president stated that his administration remained interested in dealing with the matter of global warming, but would endorse alternative measures to combat the problem, such as voluntary initiatives limiting emissions. Critics of Bush's position, however, have noted that it was the failure of voluntary initiatives to reduce emissions following the Rio Summit that led to the establishment of the Kyoto Protocol in the first place.

In the wake of the Bush administration's decision, many participant countries resigned themselves to the reality that the goals of the Kyoto Protocol might not be achieved without U.S. involvement. Nevertheless, in Bonn, [Germany](#), in July 2001, the remaining participant countries struck a political compromise on some of the key issues and sticking points, and planned to move forward with the Protocol, irrespective of the absence of the U.S. The key compromise points included the provision for countries to offset their targets with carbon sinks (these are areas of forest and farmland which can absorb carbon through the process of photosynthesis). Another compromise point within the broader Bonn Agreement was the reduction of emissions cuts of six gases from over 5 percent to a more achievable 2 percent. A third key change was the provision of funding for less wealthy countries to adopt more progressive technologies.

In late October and early November 2001, the UNFCCC's 7th Conference of the Parties met in Marrakesh, [Morocco](#), to finalize the measures needed to make the Kyoto Protocol operational. Although the UNFCCC projected that ratification of the Protocol would make it legally binding within a year, many critics noted that the process had fallen short of implementing significant changes in policy that would be necessary to actually stop or even slow climate change. They also maintained that the absence of U.S. participation effectively rendered the Protocol into being a political exercise without any substance, either in terms of transnational policy or in terms of environmental concerns.

The adoption of the compromises ensconced within the Bonn Agreement had been intended to make the provisions of the Kyoto Protocol more palatable to the U.S. In this regard, it failed to achieve its objective as the Bush administration continued to eschew participation in the international accord. Still, however, the Bonn Agreement did manage to render a number of other positive outcomes. Specifically, in 2002, key countries, such as [Russia](#), [Japan](#) and [Canada](#) agreed to ratify the protocol, bringing the number of signatories to 178. The decision by key countries to

ratify the protocol was regarded as "the kiss of life" by observers.

By 2005, on the eve of a climate change conference in London, British Prime Minister Tony Blair was hoping to deal with the problems of climate change beyond the provisions set forth in the Kyoto Protocol. Acknowledging that the Kyoto Protocol could not work in its current form, Blair wanted to open the discussion for a new climate change plan.

Blair said that although most of the world had signed on to Kyoto, the protocol could not meet any of its practical goals of cutting greenhouse gas emissions without the participation of the United States, the world's largest polluter. He also noted that any new agreement would have to include India and China -- significant producers of greenhouse gas emissions, but exempt from Kyoto because they have been classified as developing countries. Still, he said that progress on dealing with climate change had been stymied by "a reluctance to face up to reality and the practical action needed to tackle problem."

Blair also touted the "huge opportunities" in technology and pointed toward the possibilities offered by wind, solar and nuclear power, along with fuel cell technology, eco-friendly biofuels, and carbon capture and storage which could generate low carbon power. Blair also asserted that his government was committed to achieving its domestic goal of reducing carbon dioxide emissions by 20 percent by 2010.

In the United States, President George W. Bush has said that global warming remained a debatable issue and despite conclusions reached by his own Environmental Protection Agency, he has not agreed with the conclusion that global warming and climate change are linked with human activities. Bush has also refused to ratify Kyoto on the basis of its economic costs.

Australia, an ally of the United States, has taken a similarly dim view of the Kyoto Protocol. Ahead of the November 2005 climate change meeting in Canada in which new goals for the protocol were to be discussed, Australia's Environment Minister, Ian Campbell, said that negotiating new greenhouse gas emission levels for the Kyoto Protocol would be a waste of time. Campbell said, "There is a consensus that the caps, targets and timetables approach is flawed. If we spend the next five years arguing about that, we'll be fiddling and negotiating while Rome burns." Campbell, like the Bush administration, has also advocated a system of voluntary action in which industry takes up new technologies rather than as a result of compelling the reduction of emissions. But the Australian Conservation Foundation (ACF) has called on its government to ratify the Kyoto Protocol, to establish a system of emissions trading, and to set binding limits on emissions. Interestingly, although it did not sign on to Kyoto, Australia was expected to meet its emissions target by 2012 (an 8 percent increase in 1990 levels in keeping with the country's reliance on coal). But this success has nothing to do with new technologies and is due to state-based regulations on land clearing.

Note: The Kyoto Protocol calls for developed nations to cut greenhouse emissions by 5.2 percent

of 1990 levels by 2012.

Special Entry: Climate Change Summit in Copenhagen (2009) --

In December 2009, the United Nations Climate Change Summit opened in the Danish capital of Copenhagen. The summit was scheduled to last from Dec. 7-18, 2009. Delegates from more than 190 countries were in attendance, and approximately 100 world leaders, including British Prime Minister Gordon Brown and [United States](#) President Barack Obama, were expected to participate. At issue was the matter of new reductions targets on greenhouse gas emissions by 2020.

Despite earlier fears that little concurrence would come from the conference, effectively pushing significant actions forward to a 2010 conference in [Mexico](#) City, negotiators were now reporting that the talks were productive and several key countries, such as [South Africa](#), had pledged to reduce greenhouse gas emissions. The two main issues that could still lead to cleavages were questions of agreement between the industrialized countries and the developing countries of the world, as well as the overall effectiveness of proposals in seriously addressing the perils of climate change.

On Dec. 9, 2009, four countries -- the [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) -- presented a document outlining ideas for raising and managing billions of dollars, which would be intended to help vulnerable countries dealing with the perils of climate change. Described as a "green fund," the concept could potentially help small island states at risk because of the rise in sea level. [Bangladesh](#) identified itself as a potential recipient of an assistance fund, noting that as a country plagued by devastating floods, it was particularly hard-hit by climate change. The "green fund" would fall under the rubric of the United Nations Framework Convention on Climate Change, for which developed countries have been committed to quantifying their emission reduction targets, and also to providing financial and technical support to developing countries.

The [United Kingdom](#), [Australia](#), [Mexico](#) and [Norway](#) also called for the creation of a new legal treaty that would replace the Kyoto Protocol. This new treaty, which could go into force in 2012, would focus largely on the reduction of greenhouse gas emissions by 2020. But [Australia](#) went even further in saying that the successor treaty to the Kyoto Protocol, should be one with provisions covering all countries. Such a move would be a departure from the structure of the Kyoto Protocol, which contained emissions targets for industrialized countries due to the prevailing view that developed countries had a particular historic responsibility to be accountable for climate change. More recently, it has become apparent that substantial reductions in greenhouse gas emissions demanded by scientists would only come to pass with the participation also of significant developing nation states, such as [China](#) and [India](#). Indeed, one of the most pressing critiques of the Kyoto Protocol was that it was a "paper tiger" that failed to address the impact of the actions of emerging economies like [China](#) and [India](#), with its focus on the developed economies.

Now, in 2009, [China](#) -- as the world's biggest greenhouse gas emitter -- was responding this dubious distinction by vocalizing its criticism of the current scenario and foregrounding its new commitments. Ahead of the Copenhagen summit, [China](#) had announced it would reduce the intensity of its carbon emissions per unit of its GDP in 2020 by 40 to 45 percent against 2005 levels. With that new commitment at hand, [China](#) was now accusing the [United States](#) and the European Union of shirking their own responsibilities by setting weak targets for greenhouse gas emissions cuts. Senior Chinese negotiator, Su Wei, characterized the goals of the world's second largest greenhouse gas emitter -- the [United States](#) -- as "not notable," and the European Union's target as "not enough." Su Wei also took issue with [Japan](#) for setting implausible preconditions.

On Dec. 11, 2009, [China](#) demanded that developed and wealthy countries in Copenhagen should help deliver a real agreement on climate change by delivering on their promises to reduce carbon emissions and provide financial support for developing countries to adapt to global warming. In so doing, China's Vice Foreign Minister He Yafei said his country was hoping that a "balanced outcome" would emerge from the discussions at the summit. Echoing the position of the Australian government, He Yafei spoke of a draft agreement as follows: "The final document we're going to adopt needs to be taking into account the needs and aspirations of all countries, particularly the most vulnerable ones."

China's Vice Foreign Minister emphasized the fact that climate change was "a matter of survival" for developing countries, and accordingly, such countries need wealthier and more developed countries to accentuate not only their pledges of emissions reduction targets, but also their financial commitments under the aforementioned United Nations Framework Convention on Climate Change. To that end, scientists and leaders of small island states in the Indian Ocean, the Pacific Ocean and the Caribbean Sea, have highlighted the existential threat posed by global warming and the concomitant rise in sea level.

China aside, attention was also on [India](#) -- another major player in the developing world and a country with an industrializing economy that was impacting the environment. At issue was the Indian government's decision to set a carbon intensity target, which would slow emissions growth by up to 25 percent by the 2020 deadline. This strong position was resisted by some elements in [India](#), who argued that their country should not be taking such a strong position when developed wealthy countries were yet to show accountability for their previous commitments to reduce greenhouse gas emissions. The matter grew so heated that the members of the opposition stormed out of the parliament in protest as Indian Environment Minister Jairam Ramesh defended the policy. But the political pressure at home in [India](#) was leaving the Indian delegation in Copenhagen in a state of chaos as well. In fact, India's top environmental negotiator refused to travel to Copenhagen in protest of the government's newly-announced stance.

China and [India](#) were joined by [Brazil](#) and [South Africa](#) in the crafting of a draft document calling for a new global climate treaty to be completed by June 2010. Of concern has been the realization

that there was insufficient time to find concurrence on a full legal treaty, which would leave countries only with a politically-binding text by the time the summit at Copenhagen closed. But Guyana's leader, President Bharrat Jagdeo, warned that the summit in [Denmark](#) would be classified as a failure unless a binding document was agreed upon instead of just political consensus. He urged his cohorts to act with purpose saying, "Never before have science, economics, geo-strategic self-interest and politics intersected in such a way on an issue that impacts everyone on the planet."

Likewise, [Tuvalu](#) demanded that legally binding agreements emerge from Copenhagen. Its proposal was supported by many of the vulnerable countries, from small island states and sub-Saharan Africa, all of whom warned of the catastrophic impact of climate change on their citizens. [Tuvalu](#) also called for more aggressive action, such as an amendment to the 1992 agreement, which would focus on sharp greenhouse gas emissions and the accepted rise in temperatures, due to the impact the rise in seas. The delegation from [Kiribati](#) joined the call by drawing attention to the fact that one village had to be abandoned due to waist-high water, and more such effects were likely to follow. Kiribati's Foreign Secretary, Tessie Lambourne, warned that the people of [Kiribati](#) could well be faced with no homeland in the future saying, "Nobody in this room would want to leave their homeland." But despite such impassioned pleas and irrespective of warnings from the Intergovernmental Panel on Climate Change that the rise in sea level from melting polar ice caps would deleteriously affect low-lying atolls such as such as [Tuvalu](#) and [Kiribati](#) in the Pacific, and the [Maldives](#) in the Indian Ocean, the oil-giant [Saudi Arabia](#) was able to block this move.

Meanwhile, within the developed countries, yet another power struggle was brewing. The European Union warned it would only agree to raise its target of 20 percent greenhouse gas emissions reductions to 30 percent if the [United States](#) demonstrated that it would do more to reduce its own emissions. It was unknown if such pressure would yield results. [United States](#) President Barack Obama offered a "provisional" 2020 target of 17 percent reductions, noting that he could not offer greater concessions at Copenhagen due to resistance within the [United States](#) Congress, which was already trying to pass a highly controversial "cap and trade" emissions legislation. However, should that emissions trading bill fail in the Senate, the [United States](#) Environment Protection Agency's declaration that greenhouse gases pose a danger to human health and the environment was expected to facilitate further regulations and limits on power plants and factories at the national level. These moves could potentially strengthen the Obama administration's offering at Copenhagen. As well, President Obama also signaled that he would be willing to consider the inclusion of international forestry credits.

Such moves indicated willingness by the Obama administration to play a more constructive role on the international environmental scene than its predecessor, the Bush administration. Indeed, ahead of his arrival at the Copenhagen summit, President Barack Obama's top environmental advisors promised to work on a substantial climate change agreement. To that end, [United States](#)

Environmental Protection Agency Administrator Lisa Jackson said at a press conference, "We are seeking robust engagement with all of our partners around the world." But would this pro-engagement assertion yield actual results?

By Dec. 12, 2009, details related to a draft document prepared by Michael Zammit Cutajar, the head of the Ad-hoc Working Group on Long-Term Cooperative Action, were released at the Copenhagen climate conference. Included in the document were calls for countries to make major reductions in carbon emissions over the course of the next decade. According to the Washington Post, industrialized countries were called on to make cuts of between 25 percent and 40 percent below 1990 levels -- reductions that were far more draconian than the [United States](#) was likely to accept. As discussed above, President Obama had offered a provisional reduction target of 17 percent. The wide gap between the released draft and the United States' actual stated position suggested there was much more negotiating in the offing if a binding agreement could be forged, despite the Obama administration's claims that it was seeking greater engagement on this issue.

In other developments, the aforementioned call for financial support of developing countries to deal with the perils of climate change was partly answered by the European Union on Dec. 11, 2009. The European bloc pledged an amount of 2.4 billion euros (US\$3.5 billion) annually from 2010 to 2012. Environment Minister Andreas Carlgren of [Sweden](#) -- the country that holds the rotating presidency of the European Union at the time of the summit -- put his weight behind the notion of a "legally binding deal." Meanwhile, Yvo de Boer, a top United Nations climate change official, focused less on the essence of the agreement and more on tangible action and effects saying, "Copenhagen will only be a success if it delivers significant and immediate action that begins the day the conference ends."

The division between developed and developing countries in Copenhagen reached new heights on Dec. 14, 2009, when some of the poor and less developed countries launched a boycott at the summit. The move, which was spurred by African countries but backed by [China](#) and [India](#), appeared to be geared toward redirecting attention and primary responsibility to the wealthier and more industrialized countries. The impasse was resolved after the wealthier and more industrialized countries offered assurances that they did not intend on shirking from their commitments to reducing greenhouse gases. As a result, the participating countries ceased the boycott.

Outside the actual summit, thousands of protestors had gathered to demand crucial global warming, leading to clashes between police and demonstrators elsewhere in the Danish capital city. There were reports of scattered violence across Copenhagen and more than 1,000 people were arrested.

Nevertheless, by the second week of the climate change summit, hopes of forging a strong deal were eroding as developed and developing nations remained deadlocked on sharing cuts in greenhouse gases, and particularly on the matters of financing and temperature goals. In a bid to

shore up support for a new climate change, [United States](#) President Barack Obama joined other world leaders in Copenhagen. On Dec. 14, 2009, there was a standoff brewing between the [United States](#) and [China](#). At issue was China's refusal to accept international monitoring of its expressed targets for reducing greenhouse gas emissions. The [United States](#) argued that China's opposition to verification could be a deal-breaker.

By the close of the summit, the difficult process eventually resulted in some consensus being cultivated. A draft text called for \$100 billion a year by 2020 to assist poor nations cope with climate change, while aiming to limit global warming to two degrees Celsius compared with pre-industrial levels. The deal also included specific targets for developed countries to reduce greenhouse gas emissions, and called for reductions by developing countries as a share of their economies. Also included in the agreement was a mechanism to verify compliance. The details of the agreement were supported by President Barack Obama, Chinese Premier Wen Jiabao, Indian Prime Minister Manmohan Singh and Brazilian President Luiz Inacio Lula da Silva.

This draft would stand as an interim agreement, with a legally-binding international pact unlikely to materialize until 2010. In this way, the summit in Copenhagen failed to achieve its central objective, which was to negotiate a successor to the Kyoto Protocol on greenhouse gas emissions.

Editor's Note

In the background of these developments was the growing global consciousness related to global warming and climate change. Indeed, as the Copenhagen summit was ongoing, it was clear there was enormous concurrence on the significance of the stakes with an editorial on the matter of climate change being published in 56 newspapers in 45 countries. That editorial warned that without global action, climate change would "ravage our planet." Meanwhile, a global survey taken by Globescan showed that concern over global warming had exponentially increased from 1998 -- when only 20 percent of respondents believed it to be a serious problem -- to 64 percent in 2009. Such survey data, however, was generated ahead of the accusations by climate change skeptics that some climate scientists may have overstated the case for global warming, based on emails derived in an illicit manner from a British University.

Special Entry: Climate change talks in Doha in [Qatar](#) extend life of Kyoto Protocol (2012)

December 2012 saw climate talks ensue in the Qatari city of Doha as representatives from countries across the world gathered to discuss the fate of the Kyoto Protocol, which seeks to minimize greenhouse gas emissions. The summit yielded results with decisions made (1) to extend the Kyoto Protocol until 2020, and (2) for wealthier countries to compensate poorer countries for the losses and damage incurred as a result of climate change.

In regards to the second matter, Malia Talakai of [Nauru](#), a leading negotiator for the Alliance of Small Island States, explained the necessity of the compensation package as follows: “We are trying to say that if you pollute you must help us.”

This measure was being dubbed the "Loss and Damage" mechanism, and was being linked with [United States](#) President Barack Obama's request for \$60 billion from Congress to deal with the devastation caused by Hurricane Sandy months before. The sight of a hurricane bearing down on the northern Atlantic seaboard, along with the reality of the scope of reconstruction, appeared to have illustrated the economic costs of climate change -- not so much as a distant environmental issue -- but as a danger to the quotidian lives of people. Still, there was blame to be placed on the [United States](#) and European countries -- some of world's largest emitters -- for failing to do more to reduce emissions.

To that latter end, there was in fact little progress made on the central issue of reducing greenhouse gas emissions. Had those emissions been reduced, there would have been less of a need to financially deal with the devastation caused by climate change. One interpretation was that the global community was accepting the fact that industrialization was contributing to global warming, which had deleterious effects on the polar ice caps and concomitantly on the rise of sea level, with devastating effects for small island nations. Thus, wealthier countries were willing to pay around \$10 billion a year through 2020, effectively in "damages," to the poor countries that could be viewed as the "collateral damage" of industrial progress. But damages today could potentially be destruction tomorrow, leaving in place the existential challenges and burdens to be born by some of the world's smallest and least wealthy island countries.

Perhaps not surprisingly, the representative for the small island nation states at the Doha summit responded with ire, characterizing the lack of progress on reducing emissions as follows: "We see the package before us as deeply deficient in mitigation (carbon cuts) and finance. It's likely to lock us on the trajectory to a 3,4,5C rise in global temperatures, even though we agreed to keep the global average temperature rise of 1.5C to ensure survival of all islands. There is no new finance (for adapting to climate change and getting clean energy) -- only promises that something might materialize in the future. Those who are obstructive need to talk not about how their people will live, but whether our people will live."

Indeed, in most small island countries not just in the Pacific, but also the Caribbean and Indian Ocean, ecological concerns and the climate crisis have been dominant themes with dire life and death consequences looming in the background for their people. Small island nations in these region are already at risk from the rise of sea-level, tropical cyclones, floods. But their very livelihoods of fishing and subsistence farming were also at risk as a result of ecological and environmental changes. Increasingly high storm surges can wipe out entire villages and contaminate water supplies. Accordingly, the very existence of island nations, such as [Kiribati](#) and [Tuvalu](#), are at severe risk of being obliterated from the map. Yet even with the existential threat of being wiped

off the map in the offing, the international community has been either slow or restrictive in its efforts to deal with global warming, climate change, economic and ecological damage, as well as the emerging global challenge of environmental refugees.

A 2012 report from the United Nations Environment Program (UNEP) and the Pacific Regional Environment Program underlined the concerns of small island nations and their people as it concluded that the livelihoods of approximately 10 million people in Pacific island communities were increasingly vulnerable to climate change. In fact, low-lying islands in that region would likely confront losses of up to 18 percent of gross domestic product due to climate change, according to the report. The report covers 21 countries and territories, including [Fiji](#), [Kiribati](#), [Samoa](#) and [Tonga](#), and recommended environmental legislation intended to deal with the climate crisis facing the small island countries particularly. As noted by David Sheppard, the director general of the Pacific Regional Environment Program that co-sponsored this study: "The findings... emphasize the need more than ever to raise the bar through collective actions that address the region's environmental needs at all levels."

Regardless of the failures of the summit in [Qatar](#) (discussed above), the meeting did facilitate a process starting in 2015, which would bind both wealthy and poor countries together in the mission of forging a new binding treaty that would replace the Kyoto Protocol and tackle the central causes of climate change.

For more information on the threats faced in small island nations by climate change and the measures being undertaken to lobby for international action, please see the Alliance for Small Island States available online at the URL: <http://aosis.org/>

Special Report

COP 21 summit in Paris ends with historic agreement to tackle climate change; rare international consensus formed on environmental crisis facing the planet (2015) --

In mid-December 2015, the highly-anticipated United Nations climate conference of parties (COP) in Paris, [France](#), ended with a historic agreement. In fact, it would very likely be understood as the most significant international agreement signed by all the recognized countries of the world since the Cold War. Accordingly, the Paris Agreement was being distinguished as the first multilateral pact that would compel all countries across the world to cut its carbon emissions -- one of the major causes of increasing greenhouse gas emissions, which contribute to global warming, and its deleterious effects ranging from the dangerous rise in sea level to catastrophic climate change.

The accord, which was dubbed to be the "Paris Agreement," was the work of rigorous diplomacy

and fervent environmental advocacy, and it aimed to address the climate change crisis facing the planet. As many as 195 countries were represented in the negotiations that led to the landmark climate deal. Indeed, it was only after weeks of passionate debate that international concurrence was reached in addressing the environmental challenges confronting the world, with particular attention to moving beyond fossil fuels and reducing greenhouse gas emissions.

The success of the COP 21 summit in Paris and the emergence of the landmark Paris Agreement was, to some extent, attributed to the efforts of France's Foreign Minister Laurent Fabius who presided over the negotiations. The French foreign minister's experience and credentials as a seasoned diplomat and respected statesman paid dividends. He skillfully guided the delegates from almost 200 countries and interest groups along the negotiations process, with ostensibly productive results and a reasonably robust deal to show for it.

On Dec. 12, 2015, French Foreign Minister Fabius officially adopted the agreement, declaring: "I now invite the COP to adopt the decision entitled Paris Agreement outlined in the document. Looking out to the room I see that the reaction is positive, I see no objections. The Paris agreement is adopted." Once Foreign Minister Fabius' gavel was struck, symbolically inaugurating the Paris Agreement into force, the COP delegate rushed to their feet with loud and bouyant cheers as well as thunderous applause.

In general, the Paris Agreement was being hailed as a victory for enviromental activists and a triumph for international diplomats, while at the same time being understood as simply an initial -- and imperfect -- move in the direction of a sustainable future. China's chief negotiator, Xie Zhenhua, issued this message, saying that while the accord was not ideal, it should "not prevent us from marching historical steps forward."

United States President Barack Obama lauded the deal as both "ambitious" and "historic," and the work of strenuous multilateral negotiations as he declared, "Together, we've shown what's possible when the world stands as one." The [United States](#) leader acknowledged that the accord was not "perfect," but he reminded the critics that it was "the best chance to save the one planet we have."

Former [United States](#) Vice President Al Gore, one of the world's most well known environmental advocates, issued a lengthy statement on the accomplishments ensconced in the Paris Agreement. He highlighted the fact that the Paris Agreement was a first step towards a future with a reduced carbon footprint on Planet Earth as he said, "The components of this agreement -- including a strong review mechanism to enhance existing commitments and a long-term goal to eliminate global-warming pollution this century -- are essential to unlocking the necessary investments in our future. No agreement is perfect, and this one must be strengthened over time, but groups across every sector of society will now begin to reduce dangerous carbon pollution through the framework of this agreement."

The central provisions of the Paris Agreement included the following items:

- Greenhouse gas emissions should peak as quickly as possible, with a move towards balancing energy sources, and ultimately the decrease of greenhouse gases in the second half of this century
- Global temperature increase would be limited to 1.5 degrees Centigrade above pre-industrial levels and would be held "well below" the two degrees Centigrade threshold
- Progress on these goals would be reviewed every five years beginning in 2020 with new greenhouse gas reduction targets issued every five years
- \$100 billion would be expended each year in climate finance for developing countries to move forward with green technologies, with further climate financing to be advanced in the years beyond

It should be noted that there both legally binding and voluntary elements contained within the Paris Agreement. Specifically, the submission of an emissions reduction target and the regular review of that goal would be legally mandatory for all countries. Stated differently, there would be a system in place by which experts would be able to track the carbon-cutting progress of each country. At the same time, the specific targets to be set by countries would be determined at the discretion of the countries, and would not be binding. While there was some criticism over this non-binding element, the fact of the matter was that the imposition of emissions targets was believed to be a major factor in the failure of climate change talks in Copenhagen, [Denmark](#), in 2009.

In 2015, the talks faced challenges as several countries, such as [China](#) and [India](#), objected to conditions that would stymie economic and development. In order to avoid that kind of landmine, a system Intended Nationally Determined Contributions (INDCs) was developed and formed the basis of the accord. As such, the Paris Agreement would, in fact, facilitate economic growth and development, as well as technological progress, but with the goal of long-term ecological sustainability based on low carbon sources. In fact, the agreement heralded as "the beginning of the end of the fossil fuel era." As noted by Nick Mabey, the head of the climate diplomacy organization E3G, said, "Paris means governments will go further and faster to tackle climate change than ever before. The transition to a low carbon economy is now unstoppable, ensuring the end of the fossil fuel age."

A particular sticking point in the agreement was the \$100 billion earmarked for climate financing for developing countries to transition from traditional fossil fuels to green energy technologies and a low carbon future. In 2014, a report by the International Energy Agency indicated that the cost of that transition would actually be around \$44 trillion by the mid-century -- an amount that would render the \$100 billion being promised to be a drop in the proverbial bucket. However, the general expectation was that the Republican-controlled Senate in the [United States](#), which would have to ratify the deal in that country, was not interested in contributing significant funds for the cause of climate change.

A key strength of the Paris Agreement was the ubiquitous application of measures to all countries. Of note was the frequently utilized concept of "flexibility" with regard to the Paris Agreement. Specifically, the varying capacities of the various countries in meeting their obligations would be anticipated and accorded flexibility. This aspect presented something of a departure from the 1997 Kyoto Protocol, which drew a sharp distinction between developed and developing countries, and mandated a different set of obligations for those categories of countries. Thus, under Kyoto, [China](#) and [India](#) were not held to the same standards as the [United States](#) and European countries. In the Paris Agreement, there would be commitments from all countries across the globe.

Another notable strength of the Paris Agreement was the fact that the countries of the world were finally able to reach consensus on the vital necessity to limit global temperature increases to 1.5 degrees Centigrade. Ahead of the global consensus on the deal, and as controversy continued to surface over the targeted global temperature limits, the leaders of island countries were sounding the alarm about the melting of the Polar ice caps and the associated rise in sea level. Prime Minister Enele Sopoaga of [Tuvalu](#) issued this dismal reminder: "Tuvalu's future ... is already bleak and any further temperature increase will spell the total demise of [Tuvalu](#). No leader in this room carries such a level of worry and responsibility. Just imagine you are in my shoes, what would you do?" It was thus something of a victory for environmental advocates that the countries of the world could find consensus on the lower number -- 1.5 degrees rather than 2 degrees.

A significant weak point with regard to the Paris deal was a "loss and damage" provision, which anticipates that even with all the new undertakings intended to reduce greenhouse gas emissions and move to a low carbon future, there would nonetheless be unavoidable climate change consequences. Those consequences ranged from the loss of arable land for farmers as well as soil erosion and contamination of potable water by sea water, to the decimation of territory in coastal zones and on small islands, due to the rise in sea level, with entire small island countries being rendered entirely uninhabitable. The reality was that peoples' homes across the world would be destroyed along with their way of life.

With that latter catastrophic effect being a clear and present danger for small island countries, the Association of Small Island States (AOSIS) demanded that the developed world acknowledge its responsibility for this irreversible damage.. Despite the fact that greenhouse gas emissions and the ensuing plague of global warming was, indeed, the consequence of development in the West (the [United States](#) and Europe) and the large power house countries, such as [Russia](#), [China](#) and [India](#), there was no appetite by those countries to sign on to unlimited liability. Under the Paris Agreement, there was a call for research on insurance mechanisms that would address loss and damage issues, with recommendations to come in the future.

The call for research was being regarded as an evasion of sorts and constituted the weakest aspect of the Paris Agreement. Not surprisingly, a coalition of small island nations demanded a "Marshall

Plan" for the Pacific. Borrowing the term "Marshall Plan" from the post-World War II reconstruction effort, the coalition of Pacific island nation, which included [Kiribati](#), [Tuvalu](#), [Fiji](#), and the [Marshall Islands](#), called for an initiative that would include investment in renewable energy and shoreline protection, cultural preservation, economic assistance for economies in transition, and a plan for migration and resettlement for these countries as they confront the catastrophic effects of the melting of the Polar ice caps and the concomitant rise in sea level. The precise contours of the initiative remained unknown, unspecified, and a mere exercise in theory at the time of writing. Yet such an initiative would, at some point, have to be addressed, given the realities of climate change and the slow motion calamity unfolding each day for low-lying island nations across the world.

As noted by Vice President Greg Stone of Conservation International, who also functions as an adviser to the government of [Kiribati](#), "Imagine living in a place where you know it's going to go away someday, but you don't know what day that wave's going to come over and wash your home away." He added, "It's a disaster we know is going to happen." Meanwhile, the intervening years promised to be filled with hardship for small island nations, such as [Kiribati](#). Stone explained, "For every inch of sea-level rise, these islands lose 10 feet of their freshwater table to saltwater intrusion," Stone explained. "So it's not just about the day the water finally goes over the island; it's also about the day that there's just not enough water left and everyone has to move off the island." Presaging the future for island nations that could face submersion, Stone said, "If you look ahead 50 years, a country like [Kiribati](#) could become the first aqueous nation. possibility of migration. That is, they own this big patch of ocean, and they administer it from elsewhere."

Foreign Minister Minister Tony Debrum of the [Marshall Islands](#) emerged as the champion advocating on behalf of small island nation states and a loose coalition of concerned countries from the Pacific to the Caribbean, but with support from the [United States](#). He addressed the comprehensive concerns of small island nations regarding the weaknesses of the deal, while simultaneously making clear that the Paris Agreement signified hope for the countries most at risk. In a formal statement, Debrum declared: "We have made history today. Emissions targets are still way off track, but this agreement has the tools to ramp up ambition, and brings a spirit of hope that we can rise to this challenge. I can go back home to my people and say we now have a pathway to survival." Debrum highlighted the imperatives of Pacific island nations, saying, "Our High Ambition Coalition was the lightning rod we needed to lift our sights and expectations for a strong agreement here in Paris. We were joined by countries representing more than half the world. We said loud and clear that a bare-bones, minimalist agreement would not fly. We instead demanded an agreement to mark a turning point in history, and the beginning of our journey to the post-carbon era."

Debrum of the [Marshall Islands](#) espoused the quintessential synopsis of the accord and its effects for those most likely to be affected by climate change as he noted, "Climate change won't stop

overnight, and my country is not out of the firing line just yet, but today we all feel a little safer.”

Editor's Entry on [Environmental Policy](#):

The low-lying Pacific island nations of the world, including [Kiribati](#), [Tuvalu](#), the [Marshall Islands](#), [Fiji](#), among others, are vulnerable to the threats posed by global warming and climate change, derived from carbon emissions, and resulting in the rise in sea level. Other island nations in the Caribbean, as well as poor countries with coastal zones, were also at particular risk of suffering the deleterious effects of climate change.

Political policy in these countries are often connected to ecological issues, which have over time morphed into an existential crisis of sorts. Indeed, ecological concerns and the climate crisis have also been dominant themes with life and death consequences for the people of island nations in the Pacific. Indeed, the very livelihoods of fishing and subsistence farming remain at risk as a result of ecological and environmental changes. Yet even so, these countries are threatened by increasingly high storm surges, which could wipe out entire villages and contaminate water supplies. Moreover, because these are low lying island nations, the sustained rise in sea level can potentially lead to the terrain of these countries being uninhabitable at best, and submerged at worst. Stated in plain terms, these countries are at severe risk of being obliterated from the map and their plight illuminates the emerging global challenge of environmental refugees. In these manifold senses, climate change is the existential crisis of the contemporary era.

Since the time of the 1997 Kyoto Protocol, there have been efforts aimed at extending the life of that agreement, with an eye on minimizing greenhouse gas emissions, and thus minimizing the effects of climate change. Those endeavors have largely ended in failure, as exemplified by the unsuccessful Copenhagen talks in 2009 and the fruitless Doha talks in 2012 respectively. The success of the COP 21 talks in [France](#), with the adoption of the landmark Paris Agreement in 2015, was regarded as the first glimmer of hope. Not only did the Paris Agreement signify the triumph of international diplomacy and global consensus, but it also marked the start of the end of the fossil fuel era, with the path forward toward a low carbon future reliant on greener technologies. Most crucially, the Paris Agreement stood as the first significant response in recent times to the central challenge of climate change and its quotidian effects on the lives of real human beings across the world.

1. Major International Environmental Accords:

General Environmental Concerns

Convention on Environmental Impact Assessment in a Transboundary Context, Espoo, 1991.

Accords Regarding Atmosphere

Annex 16, vol. II (Environmental Protection: Aircraft Engine Emissions) to the 1044 Chicago Convention on International Civil Aviation, Montreal, 1981

Convention on Long-Range Transboundary Air Pollution (LRTAP), Geneva, 1979

United Nations Framework Convention on Climate Change (UNFCCC), New York, 1992

Vienna Convention for the Protection of the Ozone Layer, Vienna, 1985 including the Montreal Protocol on Substances that Depleted the Ozone Layer, Montreal, 1987

Accords Regarding Hazardous Substances

Convention on the Ban of the Import into Africa and the Control of Transboundary Movements and Management of Hazardous Wastes within Africa, Bamako, 1991

Convention on Civil Liability for Damage Caused during Carriage of Dangerous Goods by Road, Rail and Inland Navigation Vessels (CRTD), Geneva, 1989

Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (Basel Convention), Basel, 1989

Convention on the Transboundary Effects of Industrial Accidents, Helsinki, 1992

Convention to Ban the Importation into Forum Island Countries of Hazardous and Radioactive Wastes and to Control the Transboundary Movement and Management of Hazardous Wastes within the South Pacific Region (Waigani Convention), Waigani, 1995

European Agreement Concerning the International Carriage of Dangerous Goods by Road (ADR), Geneva 1957

FAO International Code of Conduct on the Distribution and Use of Pesticides, Rome, 1985

2. Major International Marine Accords:

Global Conventions

Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention 1972), London, 1972

International Convention for the Prevention of Pollution from Ships, 1973, as modified by Protocol of 1978 relation thereto (MARPOL 73/78), London, 1973 and 1978

International Convention on Civil Liability for Oil Pollution Damage 1969 (1969 CLC), Brussels, 1969, 1976, and 1984

International Convention on the Establishment of an International Fund for Compensation for Oil Pollution Damage 1971 (1971 Fund Convention), Brussels, 1971

Convention on Liability and Compensation for Damage in Connection with the Carriage of Hazardous and Noxious Substances by Sea (HNS), London 1996

International Convention on Oil Pollution Preparedness, Response, and Co-operation (OPRC), London, 1990

International Convention Relation to Intervention on the High Seas in Cases of Oil Pollution Casualties (Intervention Convention), Brussels, 1969

United Nations Convention on the Law of the Sea (UNCLOS), Montego Bay, 1982

Regional Conventions

Convention for the Prevention of Marine Pollution by Dumping from Ships and Aircraft (Oslo Convention), Oslo, 1972

Convention for the Prevention of Marine Pollution from Land-based Sources (Paris Convention), Paris, 1974

Convention for the Protection of the Marine Environment of the North East Atlantic (OSPAR Convention), Paris, 1992

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1974 Helsinki Convention), Helsinki 1974

Convention for the Protection of the Marine Environment of the Baltic Sea Area (1992 Helsinki Convention), Helsinki 1992

Conventions within the UNEP Regional Seas Programme

Convention on the Protection of the Black Sea against Pollution, Bucharest, 1992

Convention for the Protection and Development of the Marine Environment of the Wider Caribbean Region, Cartagena de Indias, 1983

Convention for the Protection, Management, and Development of the Marine and Coastal Environment of the Eastern African Region, Nairobi, 1985

Kuwait Regional Convention for Co-operation on the Protection of the Marine Environment from Pollution, [Kuwait](#), 1978

Convention for the Protection and Development of the Marine Environment and Coastal Region of the Mediterranean Sea (Barcelona Convention), Barcelona, 1976

Regional Convention for the Conservation of the Red Sea and Gulf of Aden Environment, Jeddah, 1982

Convention for the Protection of the Natural Resources and Environment of the South Pacific Region, Noumea, 1986

Convention for the Protection of the Marine Environment and Coastal Area of the South-East Pacific, Lima, 1981

Convention for Co-operation in the Protection and Development of the Marine and Coastal Environment of the West and Central African Region, Abidjan, 1981

3. Major Conventions Regarding Living Resources:

Marine Living Resources

Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR), Canberra, 1980

International Convention for the Conservation of Atlantic Tunas (ICCAT), Rio de Janeiro, 1966

International Convention for the Regulation of Whaling (ICRW), Washington, 1946

Nature Conservation and Terrestrial Living Resources

Antarctic Treaty, Washington, D.C., 1959

Convention Concerning the Protection of the World Cultural and Natural Heritage (World Heritage Convention), Paris, 1972

Convention on Biological Diversity (CBD), Nairobi, 1992

Convention on the Conservation of Migratory Species of Wild Animals (CMS), Bonn, 1979

Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), Washington, D.C., 1973

Convention on Wetlands of International Importance especially as Waterfowl Habitat (Ramsar Convention), Ramsar, 1971

Convention to Combat Desertification (CCD), Paris 1994

FAO International Undertaking on Plant Genetic Resources, Rome, 1983

International Tropical Timber Agreement, 1994 (ITTA, 1994), Geneva, 1994

Freshwater Resources

Convention on the Protection and Use of Transboundary Watercourses and International Lakes, Helsinki, 1992

4. Major Conventions Regarding Nuclear Safety:

Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency (Assistance Convention), Vienna, 1986

Convention on Early Notification of a Nuclear Accident (Notification Convention), Vienna, 1986

Convention on Nuclear Safety, Vienna, 1994

Vienna Convention on Civil Liability for Nuclear Damage, Vienna, 1963

5. Major Intergovernmental Organizations

Commission on Sustainable Development (CSD)

European Union (EU): Environment

Food and Agriculture Organization (FAO)

Global Environment Facility (GEF)

International Atomic Energy Agency (IAEA)

International Council for the Exploration of the Sea (ICES)

International Fund for Agricultural Development (IFAD)

International Labour Organization (ILO)

International Maritime Organization (IMO)

International Monetary Fund (IMF)

International Oil Pollution Compensation Funds (IOPC Funds)

Organization for Economic Co-operation and Development (OECD), Environment Policy Committee (EPOC)

United Nations Children's Fund (UNICEF)

United Nations Development Programme (UNDP)

United Nations Educational, Scientific, and Cultural Organization (UNESCO)

United Nations Environment Programme (UNEP)

United Nations Industrial Development Organization (UNIDO)

United Nations Population Fund (UNFPA)

World Bank

World Food Programme (WFP)

World Health Organization (WHO)

World Meteorological Organization (WMO)

World Trade Organization (WTO)

6. Major Non-Governmental Organizations

Atmosphere Action Network East Asia (AANE)

Climate Action Network (CAN)

Consumers International (CI)

Earth Council

Earthwatch Institute

Environmental Liaison Centre International (ELCI)

European Environmental Bureau (EEB)

Forest Stewardship Council (FSC)

Friends of the Earth International (FoEI)

Greenpeace International

International Chamber of Commerce (ICC)

International Confederation of Free Trade Unions (ICFTU)

International Planned Parenthood Federation (IPPF)

International Solar Energy Society (ISES)

IUCN-The World Conservation Union

Pesticide Action Network (PAN)

Sierra Club

Society for International Development (SID)

Third World Network (TWN)

Water Environment Federation (WEF)

Women's Environment and Development Organization (WEDO)

World Business Council for Sustainable Development (WBCSD)

World Federalist Movement (WFM)

World Resources Institute (WRI)

World Wide Fund For Nature (WWF)

7. Other Networking Instruments

Arab Network for Environment and Development (RAED)

Global Legislators for a Balanced Environment (GLOBE)

Regional Environmental Center for Central and Eastern Europe (REC)

United Nations Non-Governmental Liaison Service (UN-NGLS)

Methodology Notes for Economic Data:

Estimates by CountryWatch.com of GDP in dollars in most countries are made by converting local currency GDP data from the International Monetary Fund World Economic Outlook to US dollars by market exchange rates estimated from the International Monetary Fund International Financial Statistics and projected out by the CountryWatch Macroeconomic Forecast. Real GDP was estimated by deflating current dollar values by the US GDP Implicit Price Deflator.

Exceptions to this method were used for:

- Bosnia-Herzegovina
- Nauru
- Cuba
- Palau
- Holy See
- San Marino
- Korea, North
- [Serbia](#) & Montenegro
- Liberia
- Somalia
- Liechtenstein
- Tonga
- Monaco
- Tuvalu

In these cases, other data and/or estimates by CountryWatch.com were utilized.

Note on Edition Dates:

The earlier edition dates are noted above because they were used to formulate the original country reviews and serve as the baseline for some of the information covered. Later editions have been used in some cases, and are cited as such, while other more recent online resources (cited above) contain recent and ever-updated data sets used for research.

Methodology Notes for the HDI:

Since 1990, the United Nations Development Programme, in concert with organizations across the globe, has produced the [Human Development Index](#) (or HDI). According to the UNDP, the index measures average achievement in basic human development in one simple composite index, and produces from this index a ranking of countries. The HDI is a composite of three basic components of human development: longevity, knowledge and standard of living. Longevity is measured by life expectancy. Knowledge is measured by combination of adult literacy and mean

years of schooling. Standard of living is measured by purchasing power, based on real GDP per capita (in constant US\$) adjusted for differences in international living costs (or, purchasing power parity, PPP). While the index uses these social indicators to measure national performance with regard to human welfare and development, not all countries provide the same level of information for each component needed to compute the index; therefore, as in any composite indicator, the final index is predicated on projections, predictions and weighting schemes. The index is a static measure, and thus, an incomplete measure of human welfare. In fact, the UNDP says itself the concept of human development focuses on the ends rather than the means of development and progress, examining in this manner, the average condition of all people in a given country.

Specifically, the index is calculated by determining the maximum and minimum for each of the three components (as listed above) and then measuring where each country stands in relation to these scales-expressed as a value between 0 and 1. For example, the minimum adult literary rate is zero percent, the maximum is 100 percent, and the reading skills component of knowledge in the HDI for a country where the literacy rate is 75 percent would be 0.75. The scores of all indicators are then averaged into the overall index.

For a more extensive examination of human development, as well as the ranking tables for each participating country, please visit: <http://www.undp.org>
